Rice and Coffee Hulling Machinery

Improved Rice Huller and Polisher.

OUR RICE HULLER

Is the only machine that will take rough rice and in one operation make it merchantable. For simplicity, durability and economy has no equal. They are used on plantations, and also in the largest mills. Both the Coffee and Rice Hullers are made of iron and steel, and can be knocked down and packed for mule transportation if desired.

OUR COFFEE HULLER

Will hull pulped or cherry coffee without breaking or leaving unhulled a single grain. The products will come out clean, polished and free from hulls, ready for bagging, all in one operation. It is the **Only** machine that will grind the hulls fine, so that they may be sucked by the blower through the screen underneath the machine, leaving every grain of coffee inside of the machine, no matter how small it may be.

Latest Engelberg Coffee Huller.

SEND FOR CIRCULAR OF OUR NEW MACHINES, WITH PRICES AND ALL INFORMATION.

Lunkenheimer Clip Gate Valves

BRANCHES: New York, 26 Cortlandt Street.
London, 35 Great Dover Street, S. E.
Paris, 24 Boulevard Voltaire.

have single discs, but double seated, and take pressure from either end. Made in screw ends from ½ inch and flange ends 2 inches and larger. Made of cast iron; all wearing parts of brass. Body and hub held together by a steel clip, hence easily taken apart. Joint between body and hub made indestructible by an imbedded seamless oval copper wire washer. Compact and unequalled for all ordinary pressures. Made also in ALL IRON for cyanide and other acids. Every valve rigidly tested and inspected before shipment. Specify them and order from any leading export house. Write for catalog of Brass and Iron Steam Specialties and Engineering Appliances of superior quality.

NEW YORK SALESROOM: 96 CHAMBERS STREET

DIETZ Nos. 30 and 60 TUBULAR SEARCH LIGHTS.

These lamps are made for outdoor or indoor use. They give a powerful and brilliant light, and are not affected by the wind.

They are suitable for use in mills workshops, warehouses, stables and summer resorts, or in any other place where a good light is required which will not be affected by strong breezes.

Where it is desired to light up a long row of animals or a long, narrow room of any kind, these lamps are especially desirable.

No. 30 is fitted with our patent bull's-eye lens on perforated plate, adding to the appearance of the light.

No. 30 has a blizzard globe, 1-inch wick and a bright tin reflector 12 inches in diameter. Price, \$30.00 dozen.

No. 60 has a No. 2 globe, 1½-inch wick and a bright tin reflector 16 inches in diameter. Price, \$72.00 dozen.

We are pleased to send complete catalogues (Spanish or English) and price list to those interested.

J. A. WRIGHT & CO.'S SPECIALTIES ARE GOOD SELLERS

The Profit you make by Selling our Specialties is not the only thing—a Satisfied Customer is Another Result.

THE BEST IN AMERICA.

We say without fear of successful contradiction that SILVER CREAM is the best Silver Polish this country has ever produced.

SILVER CREAM is absolutely free from acids, grit or other injurious substances. It is unequalled for Polishing and Cleaning articles of Gold and Silver, also Cut Glass, Window Glass, Mirrors, Gloss Paint, Marble, Porcelain Bath Tubs, Kitchen Utensils, Etc.

Brightens the Metal World.

It may be possible to make a better polish for metal than NEW CENTURY METAL POLISH, but up to the present time it has not been done. It will clean quicker, polish brighter and last longer than any other polish. It is unsurpassed for Cleaning and Polishing articles

of Brass, Copper, Nickel and Zinc, Signs and Railings, Harness Trimmings, Show Cases, Door Knobs, Brass Fire Irons, bright work on Bicycles and Automobiles, Tin Ware, polished Steel and hundreds of other articles.

WRIGHT'S SAPONACEOUS TOOTH POWDER.

This Delightful and Efficacious Tooth Powder is carefully prepared and is the result of long experience. It contains absolutely nothing injurious. It is perfectly free from grit, acid or other harmful ingredients.

It is very pleasant to use. It quickly removes all accumulated matter, rendering the teeth white and smooth and the gums red and firm. It is delightfully cooling and refreshing to the mouth, and imparts a fragrance to the breath which is very agreeable.

Order through any reliable Export Commission Merchant in the United States. All goods sold f. o. b. New York.

Develop Your Mineral Resources

THE PORTABLE STAR DRILLING MACHINE

is especially designed for drilling oil or gas wells, water wells and mineral prospecting. Every machine is complete, and is so built as not to break or get out of order, being made to operate ENTIRELY WITHOUT SPRINGS.

F. S. Gilbert, Cleveland, Ohio, writes: "I have frequently drilled 100 feet in 24 hours with my Star. It will doubtless make possible, in time, the cultivation of the arid western desert."

John Calkins, Newton Falls, Ohio, writes: "Have two of your Star Drilling Machines, and they take the lead of all others. I have drilled 76 ft. in 10 hours, 64 ft. of it in rock."

**Star Drilling Machines are made in Ten Sizes.
Will Drill 250 to 2500 Feet.**

They are the very best machines on the market. We also manufacture Drilling and Fishing Tools.

Send for our illustrated catalogue.

THE INGERSOLL AMERICAN WATCHES

THE Ingersoll watches as shown here have revolutionized the watch trade of the world. They have established new standards of value. Buyers of watches, in justice to their own interests, must consider this line. Foreign buyers have long been accustomed to purchasing cheap watches, both cheap in name and quality, but we now offer an opportunity to purchase watches guaranteed to keep good time at very low prices.

Our watch factory is the largest in the world devoted solely to manufacture of timepieces. The output is five thousand watches per day, which go to all parts of the world.

PRICES

Yankee, \$7.80 doz.
Eclipse, \$10.20 doz.
Triumph, \$13.20 doz.

F. O. B. New York.

Catalogues and full information, also special discount for quantities, may be obtained through your commission house or direct from us.

"The White Lily Washers, Wash Lily White."

Such is the verdict of thousands of users throughout the "States" of the

WHITE LILY WASHER.
WASHES LILY WHITE.

White Lily Washer.

The White Lily (Rotary) Washer is made from Louisiana and Mississippi Red Cypress, which is less susceptible to expansion and contraction caused by hot or cold water than any other timber known. Our hinges are put on with bolts instead of screws, and every part is reinforced wherever necessary, thus making the

Most Durable Washing Machine Made.

By the use of a HIGH-SPEED ROTARY WASHING MACHINE you can create a soap-suds or foam without having to turn the fly-wheel so fast that the SPEED, rather than the work, tires the operator.

The speed of the White Lily Washer is 2 3/4 turns of the fly-wheel to one turn and return of the dasher. The White Lily Washer is the Highest-Speed Rotary Washing Machine made. Will create more soap-suds with less exertion, and will wash clothes cleaner than any other known washing machine.

Special Offer to Introduce Abroad:

Upon receipt of **Thirty-three dollars** (\$33.00) in U. S. gold or its equivalent we will box, ready for transportation abroad and delivered F. O. B. cars at New York City, **Six (6) White Lily Washing Machines.**

Home Scene—Carroma Billiard Table No. 50.

Carroma Billiard Table No. 50 is three feet wide and six feet long, covered with a high-grade green billiard cloth; regulation pool-shape pockets; regulation rubber pool and billiard cushions, and fitted with our **Patent Levelling Device**, which guarantees a perfectly level playing surface. **Price,.....\$25.50**
Weight, boxed, 185 pounds (82.1 kilos); 22.75 cubic feet (69.34 decimeters). Our catalogue, illustrating and describing our various styles of Combination, Library, Dining, Pool and Billiard Tables, mailed postpaid.

BOOK OF RULES,
published in English, Spanish,
German and French languages,
accompanies each game board.

Please specify language
desired.

When visiting the
WORLD'S EXPOSITION at St. Louis
during 1904 see our Exhibit in the
Manufacturers' Building,
showing our entire line of GAME
BOARDS and COMBINATION
LIBRARY, DINING,
POOL AND BILLIARD TABLES.

Visitors to the World's Exposition
are cordially invited
to visit our Works at Ludington,
Michigan, U. S. A.

No. 2—Carrom Game Board
Is furnished with equipment for Fifty (50) entertaining games.
Price, per dozen, \$18.00.

The prices here quoted (U. S. gold or its equivalent) are for **EXPORT ONLY**, and include boxing, ready for steamer, delivered f. o. b. cars New York City. NOTE.—Each Game Board measures twenty-nine (29) inches square (53.16 centimeters); one dozen Game Boards, boxed for export, weigh 206 pounds (96.4 kilos), 13.76 cubic feet (0.3896 cubic meters).

De Luxe Combination Game Board.....	65 Games, per doz.,	\$36.00
4-Surface Crown Combination Game Board. . .	100 " " "	32.00
No. 1 Crown Combination Game Board.....	65 " " "	24.00
Combination Carrom and Crokinole Game Board .	65 " " "	20.00
No. 1 Archarena Game Board.....	58 " " "	15.00

No. 2 Archarena Game Board	60 Games, per doz.,	\$21.00
No. 2 Carrom Game Board.....	50 " " "	18.00
No. 1 Nonpareil Crokinole Game Board.....	10 " " "	6.75
No. 2 Nonpareil Crokinole Game Board.....	10 " " "	7.75
No. 3 Nonpareil Crokinole Game Board.....	10 " " "	9.75

Our Illustrated Catalogue, printed in colors, showing the various styles of Game Boards made by us, mailed postpaid.
Orders received direct or through export commission houses. When ordering through the latter, to prevent errors, please mail us a duplicate of order.

CARROM-ARCHARENA COMPANY

Ludington, Mich., U. S. A.

[Founded by Root & Tinker, 1877].

WITH WHICH IS INCORPORATED

THE AMERICAN MAIL AND EXPORT JOURNAL.

[Founded by Howard Lockwood & Co., 1877].

THE JOHN C. COCHRAN COMPANY, - - - Publishers
 Bennett Building, New York.

EDWARD W. DREW, - - - Editor.

Published on the 1st of each month.

Subscription, to any part of the world, \$2.00, or an equivalent sum in any other currency. Single copies, 20 cents each. Advertising rates on application.

Entered at the New York Post Office as Second-class Matter.

ADVANCES IN AUTO INDUSTRY.

WINTER tests of commercial automobiles are planned by the Automobile Club of America, and the conditions will be made as severe as possible, in order to determine to what extent improvements may be necessary in the present methods of construction. It is proposed to have the run occur some time in February, when the machines will have to encounter snow, ice and mud, the idea being to test the capacity of the machines as all-the-year-round vehicles, which they must be in order to be commercially serviceable in zones which are not tropical. No details have yet been determined upon, but every effort will be made to provide for thoroughly effective tests, which the manufacturers are inclined to welcome, for they believe that they have very nearly achieved success in making a serviceable vehicle for commercial uses at a price that is not exorbitant. American manufacturers of automobiles have devoted a great deal of time, care and money to putting practical business vehicles upon the market, and if the February endurance tests shall develop any weak points the remedy will be at once applied, for the auto makers are anxious to secure perfection in their machines. Practical service tests in the roughest kind of weather will determine whether the automobiles have reached the real standard, but to be candid with our readers it must be said that we believe most of the commercial vehicles now manufactured in America will make a creditable showing in the forthcoming endurance test.

Electric, gasoline and steam vehicles, omitting pleasure and passenger cabs and coaches from consideration, are now so common in New York City and the lesser cities of America that they no longer attract attention. The great department stores and the large daily newspapers use them almost exclusively for the delivering of their goods, and trucks that carry tons of weight are constantly in use. They have been working now in various sorts of weather, in torrid summer and icy winter, over rough pavements and smooth asphalt streets, with a degree of satisfaction that gives considerable confidence to the manufacturers who desire to have their machines tested over rough roads under the most adverse conditions to which they may ever be subjected. Automobiles are no less liable to breakage on rough roads than other vehicles, but some unofficial tests have shown that when controlled by experts they are superior to horse-drawn vehicles. The editor of THE AMERICAN EXPORTER last winter was invited to ride in a commercial automobile at a time when the pavements were covered with the ice that had formed after a wintry rain, when owners of valuable horses preferred to keep them in the stable unless they were freshly sharp-shod, and when traffic generally was carried on under annoying and harassing conditions. The machine was put through its paces, and with the exception of a short slide on an icy decline that was as smooth as glass, the auto did its duty quite as well as it would have done it on a dry summer day. The speed at no time was over eight miles an

hour, the limit in the part of the city where the work was done, although the machine had a speed of twelve miles an hour, and deliveries were made in the ordinary course of business that would have been very difficult to make on such a day with animal power. No special effort was made to do anything unusual on this occasion; newspaper advertising or notoriety was not sought, there were no preparations for the test—it was simply a chance invitation to see what the vehicle could do. It is almost unnecessary to say that our opinion of the capability of American automobile manufacturers was much greater than it had been, although our confidence in American inventors and manufacturers has never been questioned. We have frequently had occasion to mention new ideas in automobile construction, and we have from time to time noted improvements in the manufacture of the machines. We expect to tell our readers about many more improvements, for in America new men and new ideas are constantly springing up. Absolute perfection seems sometimes to be achieved in some field of endeavor, but the progress of the country is so rapid that many people wonder what the limit will be.

NEW REPUBLIC OF PANAMA.

A NEW nation has been born since our last issue, and a new government now controls the fifty-four-mile wide neck of land which connects the two great continents of the New World. The Republic of Panama was a State of the United States of Colombia until its recent revolt, which was due to the fact that the Colombian Government had pursued a course which threatened to deprive Panama from the benefits which would follow from American ownership of the Isthmian Canal. The revolt of Panama seems to have been the natural outcome of a policy on the part of the parent Government which would inevitably have been ruinous to the people who have created the new Republic. It was also to be expected, in view of the opposition of Colombia to accepting the liberal canal offers made by this country, that the United States would look with some degree of complacency upon any turn in the course of events which would simplify the accomplishment of the purpose of the United States to build a canal across the isthmus.

President Roosevelt, we believe, quite properly instructed the representatives of the American Government upon the isthmus "to recognize a de facto government, republican in form and without substantial opposition from its own people when established," and to take such steps as might seem necessary to protect American interests and preserve our treaty rights. The President, at the same time, urged that the Governments of Colombia and Panama should settle their differences peaceably, and he at once set in motion the armed forces of the United States to prevent the two lesser countries from going to war. Americans now own a railroad across the isthmus, and our Government is required by treaty provisions to prevent any interruption of its traffic, so that the new Republic enjoys a singular advantage in securing at the outset adequate protection from invasion by its enemy.

The new Republic can hardly hope to maintain its independence unaided, but it is so situated with reference to the Panama Canal, which must be protected by the United States, that it will have all of the moral support it needs. Panama has a population of 300,000, about the number of inhabitants to be found in a fair-sized American city. It is quite small for a nation, but it holds potentially the most important commercial and military point on the American Continent, subject, of course, to treaty rights that have been guaranteed to the United States. The Republic of Panama arises out of the necessities of its inhabitants, and the growing need of the world's commerce, which latter feature of the situation was not appreciated by the obstructionists who had control of the old Colombian Government. As we said in our September issue: No obstacle can prevent the construction of a canal across the Isthmus of Panama.

THE commerce of Panama amounts to only \$3,000,000 a year, but under the new conditions there ought to be a decided improvement in its scope and monetary value.

RUSSIA AND JAPAN.

WARLIKE notes, involving Russia and Japan, have been coming from the Far East for many weeks. Despite the strained relations which have been apparent between the two governments at frequent intervals since the controversy began, Americans have been of the opinion that all of the troubles between the two nations would be amicably settled by the arts and devices of diplomacy. At the time of making this comment on the situation in the Far East there seems to be no reason for believing that either of the governments will plunge into war, although it must be said that Japan seems dissatisfied with the progress of the negotiations which, it is feared, will not be terminated before the Japanese Parliament meets on December 5th, at which time the Japanese Government wishes to be able to make a report that it has reached an agreement with Russia. Our advice is that if the difficulty is not amicably adjusted before that time the opposition party will make an attack on the Japanese ministry and violently demand war with Russia, producing a condition which may develop a dangerous situation for international commerce in the Far East.

We believe that some of our Japanese friends are unduly hasty in attributing warlike intents to the Russian Government. Russia is not likely to go to war with any other nation except upon extreme provocation, and the delays in the negotiations may have been due, as reported, to the time required to enable the Czar to have personal knowledge of what is being done by the diplomats who are conducting the negotiations. Regarding the merits of the controversy we have no comment to make at this time, but we sincerely hope that the element in Japan which stands for war will be so greatly overshadowed by the power that makes for peace that there will be no outbreak. Russia's deliberation is believed in America to be due to a desire to avoid war, rather than to make preparations for it, and it seems quite certain that the Japanese Minister is also disposed to avoid strife. Minority elements in countries are rarely able to carry their grievances beyond the danger point, and it is to be hoped that current history, when it is written, will present no exception to the rule in this connection.

War between Russia and Japan over the subjects under controversy would not be considered entirely justifiable by the other nations of the world, at least not by Americans. The damage done would be chiefly sustained by the two countries concerned, but the commerce of the world would be affected. It would be idle to speculate upon the results, for we believe that common sense will govern the responsible heads of the governments of both countries and that neither will enter a conflict that can only be costly, unsatisfactory and without substantial profit at the end. Unless we are greatly mistaken in our estimate of the metal caliber of the diplomats of Japan and Russia, it is safe to say that there will be no war.

STEEL PASSENGER CARS.

FREIGHT cars built entirely of steel are so numerous now in the United States that the *Electrical Review* thinks our railroad managers might profitably go a step further, for it asks in a recent issue: "Why not build passenger cars of steel?" Our contemporary ought to know that steel now enters to a greater proportion in the construction of passenger coaches than is generally known, and no doubt the metal will be utilized as far as possible, but all-steel passenger cars are not likely to meet with the same success as has been won by all-steel freight cars. The cars for the new electric passenger subway in New York City are not built entirely of metal, and it is believed to be impracticable to construct passenger cars in that way, but it is possible with the discoveries made in other directions in recent years to build substantial railway vehicles in part of metals, with such materials as asbestos and fireproof wood as a basis for the decorations.

Many passenger cars now in use on American railroads are built on a framework of steel, and some of the private passenger cars are so strong that nothing short of dynamite could disintegrate them. In the cars of the latter class the limit has been reached in the utilization of metal, unless all decorative effect aside from paint is aban-

doned. The public will scarcely consent to travel in vehicles that resemble the interior of a man-o'-war's bunk room, and there is now no railroad manager who would try the experiment, even if he were far removed from competitive lines of travel.

In the last five years the construction of American railroad cars has greatly improved. The surface trolley cars on many lines are more substantial than were the common passenger coaches on some of the steam railroads half a decade ago. The railroad managers generally are disposed to adopt improved methods of construction without unnecessary delay, but they are not disposed to seriously consider all-steel passenger cars until the metal workers can produce decorative effects that at present are confined only to hard woods and other materials.

STEEL GOING TO EUROPE.

CABLE reports show that there has been some agitation, with a tinge of alarm added, over the exportation of steel by the United States Steel Corporation, which was foreshadowed in the last issue of *THE AMERICAN EXPORTER*. The Associated Press, under date of November 15th, sends the following from London:

"The sale of 100,000 tons of steel by the American Steel Trust, delivery to be made at Liverpool at \$20 per ton, has caused much alarm in the Tees side district and in Leeds. The current price at Middlesbrough is \$25 a ton, and some operators say they will close their works rather than to meet this rate. At Barrow seven out of twelve blast furnaces have been closed, owing to the importation of American and German steel. This has necessitated the closing of a mine, the output of which, for twenty-nine years, has gone to make coke for Barrow steel works. The Germans have been for the last few years doing a large trade in sheet bars, and their shipments to South Wales for the year are expected reach 100,000 tons. They were in process of forming a trust, to be called the Semi-Manufactured Union, but this aggressive competition of America has upset their plans, as they cannot touch the American price."

Foreign readers of this paper have known for some time that the United States Steel Corporation had decided to reorganize its export department, and would make an effort to secure its proper share of the world's trade in its products. We have also given our readers sufficient information to show that the so-called European iron combination would never have enough cohesive force to interfere with its American competitors. To disinterested observers the present situation is certainly interesting. To those directly concerned it is of great importance, for the tide of interchange of steel and steel products seems to be drifting in favor of America. For quite some time the tendency has been toward changing the current of steel shipments, without going into details as to products, etc., and it seems that the movement eastward is now assuming substantial proportions.

AS noted in another column, a new era has dawned in the making of armor for warships, due to the discovery of Americans of a process which does not infringe upon the Krupp method, and which can be manufactured much more cheaply. The concern has received an order for 6,000 tons from the United States Government, and would have had the contract for the entire lot wanted—16,000 tons—if it could have delivered the plates in time. Some idea of the importance of this revolutionary move in the steel industry may be gathered from the fact that the Government would have saved over \$4,000,000 on the 16,000 tons if manufactured by the new process.

OUR trade with Mexico is increasing rapidly, the total now being approximately \$83,000,000 annually. Our largest item of export is iron and steel manufactures, including \$7,000,000 worth of machinery last year. All of which shows that our southern neighbor is sharing our own prosperity.

ADVOCATES of metal roofs for buildings have advanced a new argument in favor of this comparatively recent innovation, which is of considerable value if subsequence, experience and observation shall sustain the present claim that such roofs are absolute protection against lightning.

ART BY MACHINERY.

LABOR-**SAVING** machinery at various times within the last decade has apparently reached its full fruition, but from time to time new devices have come upon the market, and the persons who keep posted regarding the development in this field of inventive genius in America have long since ceased to be astonished by new machines that can do more and better work than can be done by artisans equipped with their old-fashioned tools. While it is not saying too much to call some of the products of American labor-saving machines pieces of artistic value, it is quite true that American inventors have not yet undertaken to replace the sculptor and the scenic artist with machines, except so far as lithographing and other printing processes are concerned. Some American color printers have produced prints on paper that for blending of colors and real artistic merit would deceive any but the most experienced art students and critics. Some of the work which appears in high-class American magazines is puzzling as to its source and means of production, even to experts who are not acquainted with the process used. Oil and water-color paintings are reproduced with an exactness and perfection that can only cause wonder. If anything, in the magazine to which we particularly refer, the prints seem to be better than the originals. In this line there does not seem to be any possibility of improvement. Hundreds of thousands of copies of an artist's creations can be printed in the same time that it takes him to make a picture, each copy as good, if not slightly better.

The newest thing in art labor-saving machines is described in another column. It is a machine that does the work of the sculptor, instead of that of the painter, and it seems strangely at variance with the eternal fitness of earthly affairs that the inventor should be of the race of Italy, where Art is first and Machinery last. It is not surprising that American inventors have not entered the lists in this direction. No doubt some of them have thought about some machine of the sort, but the American inventors who have been successful are intensely practical men, and they would rather produce something that would contribute to the advancement of trade and commerce than use their time in devising means to carve statues mechanically. Mechanics and the arts, the practical and the impractical, the worker and the dreamer, have all come closer together within the last few years, and some of the present-day necessities are the result—things that would have been considered luxuries not so many years ago.

The American newspaper of to-day, for instance, would have been impossible fifteen years ago. Typesetting machines, each one of which does the work that required the fingers of four or five compositors, have made possible larger and better newspapers. When typesetting machines were introduced the printers scoffed at the dreamer who thought he could make metal do the work that nearly everybody else believed to be impossible. The dreamer was not of the same sort of dreamers as the men who doubted and discredited him. The use of electricity for power and other purposes in the great American newspaper offices has reached very close to its full measure. The only thing that machinery cannot do is to supply the executive power to direct it. Many men are still required to get into print a large daily paper, but their movements all depend upon the will of a central authority—a man who may sit at his desk and with a word or two change the whole current of the work of the office. Half a dozen telephones are ready to echo the word or two, batteries of typesetting machines are ready to set the type, big presses in the basement start or stop as he directs—artists hasten to reduce photographs of events that have happened within the half hour into plates that can be printed an hour later. On an afternoon paper, where time is precious and the count is by seconds, not minutes, the bent and trend of mind of every one from the managing editor down to the boy who handles papers for delivery in the basement, is to save time. Their ideas run to practical inventions, rather than to artistic effects, and even the artists have to sacrifice art for quickness at times. The man who quietly directs all of these forces often suggests improvements to his assistants that are of value. Sometimes such suggestions have resulted in valuable patents, but the man who did the work has always been the beneficiary. The trend there, as elsewhere, runs more toward practical utility than toward art.

CANADA'S PROSPERITY.

ALL the world is interested in the future of the Dominion of Canada. We discussed it at some length in our last issue, but there are phases of the situation that we did not then touch upon which are of interest to all friends and advocates of commercial progress. We pointed out the improbability of a unification of the Union—as the United States is colloquially called—and the Dominion, for many years to come. Without reverting to or reiterating what we have otherwise said on Canada's future, we have given more attention recently to our northerly neighbor than before, and feel impelled to say something about the effect of the material rather than the political conditions prevailing in Canada. Our esteemed contemporary, the *Farm Implement News*, furnishes this information and comment, which agrees with our own recent observations:

"Apparently no country is now making greater progress toward wealth and commercial importance than Canada or British North America. Her natural resources are immense and rapidly becoming developed; extensive mineral regions are being profitably exploited and vast fields of rich agricultural lands are fast being settled upon and brought under cultivation by practical and intelligent farmers, largely emigrants from the United States. No people have been more ready to avail themselves of the advantages of new methods and improved machinery than the Canadians, for no people are more intelligent and progressive. Relatively to population, Canada is now the best foreign market for our agricultural implements, and were there no tariff barriers between, her trade would be worth much more to us than that of any other country. As it is, our sales to Canada are large and steadily increasing, in spite of the Canadian tariff and preferential duties for British products."

There is something about the climate of North America that seems to impart vigor to its inhabitants, and the progress which is being made by the residents of Canada is by no means surprising. The country, as our contemporary says, is rich in resources, and its inhabitants show their progressiveness by the fact that they disregard obstacles in procuring their agricultural machinery from the United States. There can be no doubt of the general prosperity which permeates the Dominion, nor can there be any doubt of the fact that its people are as contented on the whole as is consistent with a progressive, ambitious race. The trade relations between the two contiguous nations are bound to increase, despite tariff barriers, and eventually the interchange of trade will bring about reciprocal relations that the politicians now believe to be very remote. It is worthy of note that politicians are defeated at times, they die like other mortals and even governments are changed, but the march of human progress and sweep of trade and commerce go on with the irresistible force of an ocean tide, obstructed at times perhaps by a rock or a sunken vessel, annoyed but not seriously affected, nor more than momentarily retarded. Politicians who try to interfere with trade, or restrict it beyond due bounds, soon become the derelicts of civilization and there is none to mourn their fate.

EXPLORER PEARY, of the United States Navy, has written to ascertain if the German antarctic ship *Gauss* is for sale, presumably intending to purchase it if possible for the next North Pole expedition. If Peary discovers the Pole with the aid of a German ship it will be another of the German-American victories that have frequently occurred in connection with affairs in the United States and elsewhere.

DENMARK'S King has ruled for forty years. Alert, vigorous and thoughtful of the welfare of his people, King Christian is to be congratulated on his long and successful reign. American trade with the merchants of his domain has been increasing, and that alone is proof that the conditions prevailing in the Danish kingdom are progressive.

LAST month we mentioned the increased demand for American boots and shoes abroad. The renewed growth in this branch of our export trade gives promise that the industry will soon assume greater prominence than it has been accorded in some quarters.

AMERICANS INVADE AFRICA.

THE American invasion of Africa is attracting attention throughout the world, and some of its features are of more than ordinary interest. We have printed accounts of the bridge-building exploits of Americans on the Dark Continent, and we have frequently referred to the efforts made by our exporters to extend their trade in that portion of the world. Just now Abyssinia is the object of commercial attack, and the campaign is going forward with the approval of European nations that are interested in the kingdom. Several months ago an American engineer went to Abyssinia at the invitation of King Menelek to take charge of an expedition to explore the Blue Nile from its source to its junction with the White Nile at Khartoum. The object of the expedition was to open the Blue Nile to trade and to place interior Abyssinia in water communication with the Nile and all Mediterranean countries. As the opening of the Blue Nile to commerce was to turn Abyssinian trade into channels controlled by the British, the expedition was in high favor in England, and British officers went with the American engineer to the capital of Abyssinia.

More recently United States Consul Skinner has undertaken to penetrate Abyssinia from the other side—a French port on the Gulf of Aden. Consul Skinner carries an invitation to King Menelek to visit the American World's Fair next year, and is taking with him a fine assortment of American rifles and articles of American manufacture, despite which fact the French Government extended to him the courtesy of a special train in which to go to the Abyssinian capital. His goods were also passed in free of duty, and he was given more privileges than have been enjoyed by any other commercial traveler prospecting or operating in Africa. According to the information which we have at hand, the French Government did not know just what message Consul Skinner carried to the King of Abyssinia, but it realized that his mission would be to the advantage of trade carried on through French ports. Therefore it took a friendly attitude toward him that was very pleasing to Americans at home.

All of the Americans entering Abyssinia go there by invitation from, or with the approval of, the King, and it is possible they will be able to do for Abyssinian trade what the European nations have not yet been able to do. King Menelek, with his capital surrounded by the modern artillery which he captured from the Italians, and with his soldiers armed with rifles taken from the Italian army, is suspicious of Europeans. He has nothing to fear from Americans, and if those now in his kingdom and those who are going there succeed in developing the trade of the old monarchy our own interests will not suffer, while other nations will share in the benefits of larger markets.

Wherever Americans have gone in Africa their names are associated with exploration or peaceful exploitation of commerce. They are not seeking dominion and are not land grabbers, but they seem to be exercising as much influence in the Dark Continent as the representatives of any other commercial nation, which, while it is nothing more than ought to be expected, is at the same time very gratifying to American interests everywhere.

AMERICAN SUCCESS.

ALFRED MOSELY, who has been studying American methods for the last year or so, has come to the conclusion that "it is the public school system of the United States that makes the American nation supreme." To quote Mr. Mosely further: "One of the things that we have been impressed with is the fact that infinitely more money is expended in the United States than in England for school buildings and equipment. And another thing that made a marked impression on every member of the commission was the tremendous enthusiasm with which the teacher was imbued, besides which I should also like to mention the unquenchable thirst among the pupils for knowledge. Such a combination cannot fail to produce results that afford an uplift for the people and contribute to greater effectiveness in its industrial life. One can find nothing but admiration for such a public school system as this. It is, or ought to be, America's proudest boast. It is the secret of all the wonder-

ful things she has accomplished industrially as well as in other lines."

Mr. Mosely probably did not mean to ascribe all of the success of our nation to the public school system in the concrete expression which we have quoted, but it is not to be doubted that the provisions for elementary education in the United States are adequate. Mr. Mosely speaks of the enthusiasm of the teachers whom he has observed, and we must say we believe it is this spirit of enthusiasm which permeates the average American, young or old, that has as much to do with American success as anything. "Men cannot make bricks without straw," according to a trite saying, and no more can intelligent effort be put forth in developing crude ideas without a basis of education, but it is true in America that the foundation of education is within the reach of every child, whose parents do not offer objections, and in all except the really rural districts education is compulsory for children under 14 years of age. The free educational facilities are by no means limited to the elementary schools, for higher schools are open to the children who display willingness, if not eagerness, to learn more than the lower schools can teach them. The technical schools are also within easy reach of those who have ambition. In the matter of education, as in other things, the drones are weeded out as the educational process advances, but according to statistics that have recently been available, the percentage of the delinquents is becoming smaller as time and the world go on. The man in America who has no ambition is rare. When found in a search, one meets a failure. The man with ambition has enthusiasm, except in equally rare cases. Sometimes a man with ambition but without enthusiasm may succeed, but such an individual is almost as rare as the one without ambition. Enthusiasm and interest in a man's work enables the toiler, whether he be doing intellectual or manual labor, to make play of his task and feel that he is not a "slave to capital" or the victim of "a cruel taskmaster." Mr. Mosely has probably found the foundation for American success, but he has only incidentally noticed the real and cumulative cause.

MARINE data regarding the economy and endurance of the turbine system of propulsion is so meager that the Cunard Turbine Commission has determined to enter upon a series of exhaustive practical tests between two steamships, practically alike, except that one will be a twin-screw steamboat and the other a turbine vessel. The boats chosen are high types of the work of their respective builders, and both are to be thoroughly tested by the commissioners. The water consumed will be weighed, so that it will be possible to arrive at a close approximation of the relative steam consumption of the turbine and reciprocating engines in driving the vessels at the same speed in a given displacement. It is expected that important additions to the present small fund of information concerning marine turbine engines will also result from the forthcoming tests of the new British cruiser *Amethyst*, which was recently launched. The *Amethyst* is equipped with two sets of turbines, one for high speed and the other for low speed—something entirely new in the way of equipment.

SOME novel features concerning the ownership of railroads in the United States are presented in a recent bunch of statistics. It appears that 1,600,000 persons own the railroads and that they, with the employees, receive two-thirds of the gross receipts of the companies. The other third goes for fuel, taxes, supplies and equipment. No doubt our foreign readers will be surprised to learn that railroad ownership in this country is so widely distributed.

IT is gratifying to record elsewhere that improvements are being made in the transportation of mails between the United States and Great Britain. Under the new arrangement business men in the United States can depend upon the prompt despatch of their letters to European destinations.

THE tin mines of Cornwall are safe. There will be no "invasion," as the American capitalists have concluded the royalties demanded are excessive. As a matter of interest, it may be said that the American tin industry is in very good shape.

FASTER MAILS TO EUROPE.

United States Adopts Better Methods for International Communication.

THE heaviest and most important international mails in the world are those between New York and London, and as the largest and swiftest steamships in the world are those plying on the great Atlantic highway, the mail service, judged by any standard of the past, is highly efficient. It is a peculiar fact, however, that the mail traversing eastward across the Atlantic—that is, from the United States to Great Britain—makes better time than that traveling in the opposite direction. This discrepancy is due not to quicker voyages in one direction, but to the difference between the British and American way of handling this particular branch of public business, according to a writer who has studied the subject.

It is obvious that the efficiency of the ocean mail service depends on two things—the speed of the mails in transit and the frequency with which they are despatched. The second factor is fully as important as the first, for it is evident that three sailings a week of seven or eight day boats would give a better service than one sailing of a five-day boat, since two-thirds of the mails would reach their destination more quickly.

A letter mailed in London on Wednesday is compelled to wait until Saturday before it starts on its journey overseas, and one mailed on Saturday is delayed until Wednesday. It is true that when envelopes are marked "via American packet" letters will be sent on the American line from Southampton, but comparatively few people will take the trouble to study the sailing schedules and to provide this special direction.

The English papers have frequently criticized this system of sacrificing the convenience of the business world to the profit of British steamship companies, and the London *Express* recently published a table showing that the post-office authorities frequently sacrificed a day or even two by sending mails by such ships as the Saxon and Ivernia, when one of the crack American liners, as for example, the St. Louis or St. Paul, was sailing on the same day. Striking illustrations of this delay have been afforded frequently when freight despatched by the American line has been discharged in New York and the ship that brought it has reloaded and sailed for Southampton again before the bills of lading for the import cargo have arrived by a slower British boat.

If the United States were to follow the British system it would ship all its mail by the vessels of the American line, which provides weekly sailings from New York to Southampton. So far from doing this, however, Uncle Sam invariably sends out his mail by the best available boats. The result is that mail is despatched from New York five times a week instead of twice as from England; and if a six-day boat is sailing on the same day with a nine-day boat the former carries the mail, which is again in strong contrast to the English system.

The United States authorities have undertaken to facilitate the movement of ocean mails by the establishment of sea post-offices on certain steamers in which postal clerks sort the letters and make them up in convenient packages as is done on railway mail cars. The British Post-Office never has joined in this effort, although the work of the sea post-offices frequently means a gain of from six to eight hours, sometimes even more, in the delivery of a letter.

As a further improvement in this direction the United States officials of the Post-Office have just arranged with the American line to change its sailing day, so that hereafter its ships leave New York on Saturdays instead of Wednesdays. At the same time the White Star line, which has its sailings on Wednesdays, will establish sea post-offices on its ships. As a result, the Wednesday mails will be handled as expeditiously as formerly, while there will be a decided gain in the Saturday mails. Heretofore these have been sent on the Cunard line via Liverpool, and the London letters have not been distributed until a week from the following Monday morning, as there is no distribution in London on Sundays. Under the new plan the London mail will reach its destination Saturday afternoons, and there will be a gain of from thirty to thirty-six hours in delivering a large part of the mail for all British ports.

Some idea of the tremendous extent of the commercial importance of this ocean mail business may be gained from the fact that last year the foreign branch of the New York Post-Office handled over 100,000,000 pieces of mail. This does not include the "closed mails" which pass through the office in transit from such cities as Chicago, St. Louis and San Francisco and from foreign countries like Mexico, Japan and Australia. Altogether from 5,000 to 7,000 bags of mail leave New York for Europe every week, and when one considers that each bag contains from 4,000 to 5,000 letters and from 200 to 400 papers it will be seen that the international exchange of ideas foots up an enormous total of business in the course of a year.

The New York *Herald* reports that honors were about equally divided between the trans-Atlantic liner St. Louis and the Campania in the ocean mail-carrying race, which ended on November 21st. The St. Louis mail reached London at four minutes past 10 o'clock, while that of the Campania reached London twenty-four minutes later. Only the Irish mail was landed by the Campania at Queenstown, as, owing to the small portion of her mail which was directed to London, the postal authorities had decided not to run the usual express service from that port to the metropolis.

The Campania reached Queenstown at twenty-one minutes to 3 P. M. on November 20th, after a passage of 5 days, 16 hours and 55 minutes, having left New York at 5 o'clock on the Saturday afternoon before. The St. Louis left

New York at twenty-three minutes to 12 A. M. the same day. The Campania arrived at Liverpool November 20th in time to despatch the London mail at thirty-four minutes past 5 A. M., while the St. Louis reached Southampton an hour later. Both mails were distributed at a quarter past 12 o'clock in the afternoon. Some disappointment was expressed in various quarters that the special express from Queenstown was not run, thus preventing a test under conditions that had previously existed, as it is asserted that the Campania's mails could thereby have been distributed in London by the first post in the morning.

British Study Our Methods at Niagara.

LITTLE has been said about the arrival in this country of Sir Charles Metcalfe, consulting railroad engineer of the British South Africa Company, and J. F. Jones, manager and secretary of the company, who have come from England on a special mission. The Cape to Cairo railroad is drawing nearer every day to Victoria Falls, the famous waterfalls in the Zambesi River. It is intended to utilize this water power to generate electricity for service in the coal mines only a few miles away and for other purposes. The principal purpose of our visitors is to go to Niagara Falls to inquire into the methods of transmission of power there and to collect information that may be useful in the effort to turn the immense energy of Victoria Falls to good account.

The meeting of the British Association in 1905 is to be held at Victoria Falls, and the South Africa Company intend to expend about \$35,000 to give the members a free trip and to entertain them comfortably at the falls. England's men of science will see there one of the wonders of the world.

The broad Zambesi suddenly seems to vanish into the bowels of the earth. Ages ago a wide crack was opened from bank to bank in the hard basaltic rock, and the great river suddenly disappears in the narrow, rocky chasm. At the bottom of this deep rift in the rock the engulfed waters emerge through a narrow gully on the left, which is thirty-six times narrower than the river above the falls. Any geologist would jump at the opportunity to study this remarkable freak of nature. The effort is to be made to put in at least a part of the electricity plant before the British scientific men arrive on the ground.

Livingstone's prediction with regard to these falls and the surrounding region is coming true. He believed, when he discovered Victoria Falls, nearly fifty years ago, that the region thereabouts was marked for special development. He saw water power, coal, abundant vegetable products, cattle, intelligent, though barbarous, natives, and other elements of material progress. He said in one of his books that the world would utilize this region some day, and his prediction is coming true.

Germans to Study American Methods.

THE German Colonial Society has started a project to educate the youth of that country in the practical way that prevails in America. The society, we learn, contemplates sending a number of young men to Texas agricultural and technical schools to study the methods of growing and marketing cotton. The young men will spend a year on a cotton plantation and so acquire practical experience, which they will later employ in the German colonies. The students will sign a contract to spend a number of years in the service of the German Colonial Society for the purpose of introducing the growing of cotton after the American system. The enterprise is the outgrowth of a suggestion by the German Consul at Galveston, who undertakes to make the arrangements for the preparation of the students.

The society has just sent a Texan named Becker to Dar-Es-Salaam, in German East Africa, who will be the first American cotton expert to arrive there. The latest reports from German East Africa indicate that interest in cotton growing is spreading, and that in many new communities are engaging in the industry. The crop this year will be the largest known there. Expert Becker's work will consist principally in finding new localities adapted for the growing of cotton. The Colonial Society points to recent speculation in the American market as a reason for seeking to, if possible, make Germany independent of the American supply.

Novel Bath-Tub for Invalids.—An American woman has invented a bath-tub for invalids that has some novel features. It consists of a waterproof sheet, with a surrounding air-tight tube, which can be inflated to form a raised wall around the edges of the sheet high enough to contain a considerable amount of water. When the tubes are deflated it is comparatively easy to roll or lift the patient on to the sheet, as the tubes lie flat on the bed. After the inflation is completed the water can be poured in, or a line of hose can be connected with the hot-water faucet in the bath-room or wash-bowl to fill the tub to the desired height. After the bath, the water is drained off through a short section of hose beneath the pneumatic tubing.

British Fraternal Delegates.—William Mullen and James O'Grady, the British fraternal delegates to the Boston convention, recently arrived to attend the convention of the American Federation of Labor. For ten years it has been the brotherly habit of the American and British organized workers to send delegates to one another's conventions.

NEW ERA IN MAKING ARMOR.

American Concern Will Build \$2,000,000 Plant and Use New Process of Manufacture.

THE recent award of a contract for 6,000 tons of armor for new American battleships to the Midvale Steel Works will result in the construction of a new plant at a cost of \$2,000,000 and the probable cheapening of armor in the world's market. The total amount of armor needed for our new warships is 16,000 tons, and the Midvale company offered to take the contract at a saving of hundreds of thousands of dollars to the Government. There was some doubt as to the ability of the company to furnish the entire lot in time, so the contract was divided, the remaining 10,000 tons going to other companies.

An entirely new process will be used by the company and the cost of manufacture will be greatly reduced. The bids of the old companies, which have heretofore had a monopoly in the manufacture of armor, have averaged about \$429 a ton, beside which the Government was compelled to pay \$221 a ton royalty on the Krupp process, bringing the total cost up to \$650 a ton, the limit fixed by the Federal authorities. The monopoly caused members of Congress and others to agitate the question of the Government building its own armor plant, as it was demonstrated that armor to stand the test could be made at a much lower figure. Nothing was ever done, and the Steel Trust continued to make all the armor needed in the construction of warships, receiving the limit price for its output.

But a great saving has been accomplished by giving the contract for 6,000 tons of armor plate to the Midvale Company, which is independent of the trust in every sense of the word. It was said last month that its entry into the field would mean a still greater reduction in the price of armor plate in the future. The Midvale Company, it was confidently said by a man in a position to know, could, with the new process it has perfected, make armor cheaper and in the same time as the Bethlehem or Carnegie concerns. In face of the fact that heretofore the Krupp armor in Class A has been the only process to stand the Government test, the award is looked upon as a great victory for the Midvale concern, even not considering the saving in money.

At the same time the bids were opened it was shown on the aggregate proposal that in awarding the whole contract to the Midvale Company the saving would be in the neighborhood of \$850,000 on about \$7,000,000 worth of work, there being approximately 16,000 tons to be delivered. But in further analyzing the figures it is shown that the total saving will amount to much more than this.

This is shown, for instance, by taking the contract awarded the Midvale concern, amounting to 6,000 tons. At the price for Class A Krupp armor asked by the Bethlehem and Carnegie companies the Government would be compelled to pay the trust \$429 a ton, in addition to paying \$221 a ton royalty for the use of the Krupp process. This would bring the total cost of 6,000 tons to \$3,900,000. At the price bid by the Midvale Company—\$398 a ton for Class A armor, minus the \$221 which the Government will not be made to pay for the Krupp royalty, which makes \$177 a ton—the price would be \$1,132,000.

The difference between the high bid of the Carnegie and Bethlehem companies of \$429 a ton and the Midvale bid of \$177 a ton is \$252. The saving on 16,000 tons of armor therefore would be \$4,032,000.

The improvements in armor-making are not confined to the United States. By the new Krupp process armor for naval ships the outside of the plate is so hardened that a chip from it would cut glass like a diamond, while at the same time the inside affords a high degree of toughness and solidity. An advantage of the new hardening process is that it enables armor plate to be made much thinner than formerly. The heaviest Krupp plate for battleships is not more than 12 inches in thickness, as against 24 inches ten years ago.

Will Be Largest Organ in the World.

ADVANCE in the construction of musical instruments in America will be one of the features of the World's Fair next year in St. Louis, U. S. A.

The chief exhibit will be the largest organ in the world. It is an instrument capable of producing 17,179,869,183 distinct tonal effects—a continuous performance that would last 32,600 years if a different one of these combinations were drawn every minute in those centuries of time. The impressiveness of its proportions and its overpowering volume of sound are the least of its achievements in the realm of instrumental music. Effects never heard outside the grand orchestra until the manufacture of this colossal organ places its expressive powers far in advance of other instruments. All of the wood-wind instruments of this full band are contained within its compass.

Large as a brick block—62 feet long, 40 feet high and 33 feet wide, and possessing 140 stops, 239 movements and 10,059 pipes—it overshadows the most famous instruments in Christendom. It cost, approximately, \$100,000. The two pipes drawing the lowest tones are each 32 feet long; two good-sized men, side by side, or a small pony, can pass through them. A train of ten cars is needed to transport the monster from Los Angeles, Cal., to St. Louis, Mo.

Five separate organs are combined within this enormous mass of enginery—electrical mechanism and wind pressure; the first or great organ, the second or

choir organ, the third or swell organ, the fourth or solo organ and the fifth or echo organ. The echo organ is 18 feet wide, 17 feet high and 10 feet deep. It has a special bellows 12 feet long by 4 feet wide, operated by a motor of 1½ horse-power. Five organs can be automatically played at one time by a double-roll, self-performing attachment on a separate console or key desk. This arrangement draws out the tremendous power and beauty of the five organs—a feat utterly beyond the range of human fingers.

A movable console or key desk, the only one in the United States, serves the organist in playing the great organ. His fingers must command five manuals or keyboards, making a flight of five stairs. This console, which is movable, is connected to the organ by an electric cable 150 feet long. When seated before the instrument, the musician must dominate the five manual stairs, the 140 draw-stop knobs, 5 tremolant draws and 36 couple draws, the 46 push-buttons belonging to the adjustable combination system and all the feet levers controlling the expressive powers of the whole organ. The second or self-playing console is stationary. Through the agency of the stationary key desk the greatest symphony orchestra scores can be played without having to reduce the scope of the composition to bring it within the range of human fingers.

The most sudden and subtle changes of tonality are instantly commanded by the double touch. A slightly increased pressure on the keys by the fingers of the player will add the voices of any stops drawn from the expressive division of the instrument—an addition that can be made to any note or group of notes under the fingers. It is a mechanical expedient obtained in no existing organ in the United States and in no first-class concert organ in the world.

The only organ in the world that even approaches this one is the immense instrument in the Town Hall at Sydney, New South Wales, the masterpiece of famous English builders. The Australian giant has 128 stops, as compared with the 140 stops of the World's Fair champion. The next organs in rank are those in the Cathedral at Riga, Russia; Albert Hall, London; Garden City, L. I.; Chicago Auditorium; Leeds Town Hall, England; Seville, Spain; St. Sulpice, Paris; St. George's Hall, Liverpool, and Ulm Cathedral.

The New Commercial Treaty with China.

MAILS from China last month brought the text of the treaty signed at Shanghai on October 8th by the representatives of the United States on the one side and those of the Emperor of China on the other. While it follows, like its predecessors, the general lines of the convention previously concluded with Great Britain, there are some important points of difference between the two treaties which will interest merchants engaged in commerce between the two countries. It is, for example, not without significance that the first article of the American treaty provides that the diplomatic representative of the United States in China "shall be given audience of His Majesty the Emperor whenever necessary to present his letters of credence or any communication from the President of the United States. At all such times he shall be received in a place and in a manner befitting his high position." This insistence on the place of the Emperor as the real head of the Government will be hailed by every reformer in China as a valuable aid to the cause of progress, according to the *New York Journal of Commerce*. Equally significant is the provision made in Article II that the consular officers appointed by the United States "shall hold direct official intercourse and correspondence with the local officers of the Chinese Government within their consular districts, either personally or in writing as the case may require, on terms of equality and reciprocal respect."

The sections of the American treaty which relate to customs duties exclude a good deal of matter relating to Chinese internal taxation which finds a place in the British treaty, but are otherwise virtually identical in their provisions. That is to say, in return for the abolition of all offices, stations and barriers of whatsoever kind for collecting likin, duties or such like dues on goods in transit, the Government of the United States consents to the payment of a surtax, in addition to the effective 5 per cent. import duty, of one and one-half times the amount of this duty.

American Sewing Machines in Japan.—The German press, in commenting on the sewing-machine trade in Japan, points out that the importation of American sewing machines into Japan has increased elevenfold over that of Germany since 1893, although the American machines command much higher prices than those made in Germany. The reason for this is said to be good management of American companies in their business methods, such as establishing depots and agencies all over Japan, keeping branches, where all parts of the machines can be obtained in the chief business centers; selling on the instalment plan to private persons and sending salesmen to every town and village.

Agricultural Machinery Catalogues Wanted.—Considerable interest is manifested in American agricultural implements by the Agricultural College of the Republic of Paraguay. This is the only school of agriculture in the country and is supported entirely by the Government. It has quite a number of students who make agriculture a study scientifically and practically. The director of the institution is Moises S. Bertoni, who would like to receive catalogues from American manufacturers of agricultural machinery.

Samuel Pierce Organ Pipe Co.

Manufacturers and Exporters of

Metal and Wood Organ Pipes

AND ORGAN MATERIALS.

SPECIALTIES: Decorating Front, Pipes,
Voicing Flue and Reed Pipes.

The Reason

you should buy the

Cross Oil Filter

is, that it will save money for
you.

It cuts your lubricating oil bills in
half, by filtering the waste oil usually
thrown away, making it fit for use over and
over again.

"Your Filter enables us to save from 50 to 75 per cent. of
the amount of oil used."

Manufacturer of

Hammocks, Mosquito Nettings and Canopies, Dress
Linings, Window Screen Cloth and School Bags.

CUT NO. 3/4 A

No. 122E—Size, 35x78 inches, with
spreaders; assorted colors. Price, \$5.50
(\$14.11) per dozen net.

No. 14SE—Same as above, with ad-
dition of pillow and wide valance; as-
sorted colors. Price, \$11.26 (\$27.11)
per dozen net.

No. 64SE—Size, 43x82 inches; with pillow, wide
valance and spreader; assorted colors. Price,
\$26.00 (\$58.11) per dozen net.

No. 64SE—Same as above, except "narrow val-
ance" in place of "wide valance." Price, \$21.50
(\$41.00) per dozen net.

Descriptive and Illustrated Catalogues
furnished on application.

We manufacture Hammocks of all sizes and prices. The Utopia
Hammock is patented in all the large countries of the world.

No. 726—Trapeze with Arawana
Hammock. Trapeze to be used with this
or any hammock. Price, of trapeze
alone, \$19.80 (\$42.00) per dozen net.

No. 44SE—Arawana Hammock (with-
out trapeze; size, 39x81 inches; with
spreaders, pillow and wide valance; as-
sorted colors. Price, \$20.95 (\$42.11)
per dozen net.

No. 728—Hammock Support with
Utopia Hammock. Adjustable support
(to be used with this or any other ham-
mock). Price, of support alone, \$45.00
(\$96.11) per dozen net.

No. 687—Utopia Hammock (without
support); with spreader, adjustable
pillow, wide valance and seat. Price,
\$39.90 (\$85.00) per dozen net. Adapted
for indoor and outdoor use. Degree of
recline easily changed from sitting to
sleeping position by extending or con-
tracting the frame.

These prices are
NET, free on board
New York.

No. 689—Canopy, Um-
brella Top; 90 inches
high, 9 yards around.
Price, \$1.05 (\$0.55) each
net.

Plain Mosquito Netting,
70 inches wide, per piece
of 8 yards; white, 35¢
(\$0.11); colors, 37¢
(\$0.11) net.

WILL BANISH LOCOMOTIVES.

Three Hundred Electric Motors and \$20,000,000 Worth of Equipment Ordered.

SEVERAL months ago we published some account regarding the plans of the New York Central Railroad Company to do away with the steam locomotives for its heavy trains running into almost the center of New York City. A contract has now been awarded for the electric equipment. From independent sources was learned that the contract means that within five years no passenger trains on the New York Central and New Haven lines will be hauled by steam locomotives within a radius of fifty miles from the Grand Central Station; that the entire outlying country will be brought into close touch with the business part of the city, and that the general adaptation of that motive power for railroads will be brought within the range of possibility and probability.

The power will be furnished by two immense power houses. The distribution of the power will be achieved by a number of substations. The power houses will be fitted with Curtis steam turbines. The largest size of these engines so far built is 7,500 horse-power. The engines for the New York Central power houses will probably be of still greater horse-power.

The engines which will be built for the New York Central will resemble in outward design those now in use on the Baltimore & Ohio, which have been described in *THE AMERICAN EXPORTER*, but they will be different in interior construction, as the Baltimore and Ohio engines are required to develop a speed of only ten miles an hour, while the New York Central engines will have to be able to run at sixty miles an hour. Steam engines of the standard class of the New York Central indicate, when running at sixty miles an hour, a test of 1,400 to 1,500 horse-power. The electric engines will have about 1,800 horse-power.

The appearance of the locomotive will be like a rectangle cabin built on wheels. There will be doors on either side and at both ends, permitting of easy communication should two locomotives be coupled together. There will be enough windows to afford an unobstructed view to the engine driver. The lever, which will have to be pressed down in order to apply the power, is so connected with the brakes that in case of accident to the driver its release will automatically put on the brakes, as well as shut off the power. This is said to be a new feature, intended to assure the safety of the passengers.

It is expected that the running of these trains by electricity will result in a tremendous saving, not only in fuel, but in efficiency. It will also result in a largely increased passenger traffic. The cost of the power houses, substations, equipment and locomotives necessary is conservatively estimated at between \$15,000,000 and \$20,000,000. As there are between 600 and 700 trains running every day in and out of the Grand Central Station, at least 300 electrical locomotives will be required. The passenger traffic of the New York Central at present requires 547 steam locomotives.

Engines Without Boilers Now Promised.

THE world of mechanics is to be "revolutionized" again very soon, if a story from South Bend, Ind., proves true. The inventor is F. S. Smith, and this is what his friends claim for it: "In future engines will not require boilers to generate steam. Instead they will be supplied with the steam generator—an improvement over anything in its line that the world has ever seen. Smith's invention has been completed within the last two months, and the United States Patent-Office has allowed seventeen out of nineteen claims made by the inventor. The invention is the work of four years. Every expert who has seen the generator tested is enthusiastic in declaring the principle to be the leading mechanical discovery of the century. The greatest advantages claimed for the invention are that it is non-exploding, and that it is simple to operate. In the instantaneous vaporization of water, whereby the fluid is immediately flashed into steam, the generator has decided advantages over the present steam engine. In contrast with boilers, the invention does away with safety valves, steam gauges and water-glasses. There is no storage of steam, as every ounce is used as fast as it is generated. Another advantage over the boiler is that Smith's device is compact and requires less than half the amount of space. A great saving in the amount of fuel is promised."

If Mr. Smith's invention is really what is claimed for it our readers will be duly apprised of the fact. His press agent is so enthusiastic that one is inclined to ask why he did not make his claim stronger by cutting out the necessity for any fuel at all. If there is any real merit in Mr. Smith's invention, however, it is likely to be discovered, despite the handicap which has been imposed by his press agent.

Progress of American Turbine Engines.

W. L. R. EMMETT read a paper on "Recent Steam Turbine Developments" at the Saratoga meeting of the American Street Railway Association. One of our leading electrical machine manufacturing companies has been experimenting for several years with a modification of the Parson steam turbine suggested by Mr. Curtis. A 600-kilowatt machine was constructed for use in its works, and proved so satisfactory that it was decided to apply the principle to an engine of the largest size, and the construction of a

5,000-kilowatt machine was undertaken. This engine is now installed in the works of the Commonwealth Electric Company of Chicago, and, while it had not been completely tested at the date of Mr. Emmett's address, sufficient data had been obtained for him to pronounce it an unqualified success. The turbine and electric generator together weigh about 40,000 pounds. The shaft is vertical, and the whole machine complete forms a cylinder about 25 feet high and 14 feet in diameter. Another one of these vertical shaft machines (of 500-kilowatt capacity) is installed at the works of the Newport and Fall River Street Railway Company. Mr. Emmett stated that the manufacturers now had contracts aggregating more than 200,000 kilowatts of steam turbine engines. During the discussion which followed Mr. Emmett's address it was stated that some of the best engineers in the country are still skeptical regarding the practical value of the steam turbine, and the gas engine was cited as a dangerous competitor, even if the best results claimed for the steam turbine are realized in practice. What was said as to the gas engine applies also to gasoline and hot-air engines.

Era of Trackless Trolley Cars Near at Hand.

THE following very interesting article is found in *Motor*, a magazine devoted to the interests of automobiles and their users: "Almost unnoticed, there is stealing upon us a development so important in the field of land transportation that it may soon supersede systems of vehicular traffic, themselves of recent origin, which we have come to regard as necessary and permanent features of modern civilization. I refer to the 'trackless trolley,' which, perhaps, may be best described as a cross between the automobile and the electric car.

"The thorough practicability of this new system, which consists simply of electric vehicles operating without rails, but deriving current from overhead wires, is well established. In the United States lines are planned for several sections of New England. Economy of operation and absence of rails are the principal advantages claimed for the new system. This explains the large profit that the trackless trolley has invariably shown under traffic that could not even pay interest on a rail-laid line.

"Being relieved of the necessity of carrying heavy storage batteries, an electric omnibus can be surprisingly light and yet have ample power to surmount the stiffest grades under heavy loads. The power question thus settled, the only other respect in which the expense of maintenance differs materially from that of rail-carried electric cars is in the matter of tires. With so ample a power reserve, however, and with proper springing, tires of high tractive efficiency and resiliency become of minor importance, and the expensive and short-lived pneumatic can be discarded—solid-rubber, or even iron, tires being substituted."

Pneumatic Frames vs. Air Tires for Autos.

IN seeking the solution of the eternal problem presented by pneumatic tires, an automobile with a frame cushioned by compressed air and oil combined in cylinders fitted to the body has been evolved. Jointed levers carry the jar of all impact from the axle to pistons, which work in these cylinders similarly to the pneumatic door closers, only a series of ingeniously arranged valves for the oil and compressed air within take the place of springs in taking up the reactionary movements of the air-cushion on the piston. The pistons are fitted horizontally to the frame, two in front and one in the rear, and the car is equipped with solid rubber tires.

The roughnesses of the road are not overcome at the place of contact as in the case of the pneumatic tires, but they are overcome and the expense of annoyance of punctured and bursted tires saved. Moreover, there is a great saving on the wear and tear of the springs of the car and on the frame. This was all adequately demonstrated in a trial trip of the car recently, when a party of New York investigators were taken for a ride over some of the cobblestone pavements in the suburbs. So far as the passengers were concerned, the riding was as easy as if the car had been fitted with pneumatic tires on the wheels instead of pneumatic cylinders on the frame.

German Professor on Turbines.—Advice received in the United States chronicle the fact that at a meeting of the German Society of Naval Architects at Charlottenburg recently Professor Reidle delivered an address on turbine steam engines, the invention of which, he said, was of the greatest technical and economic significance. He believed that the turbine engine was destined to produce the greatest revolution in the application of steam since the steam engine was invented. Germany, he said, was unfortunately behindhand in adopting the turbine, and he added that it will require at least two years of the hardest work to overtake those other countries which had adopted it.

American Locomotives for China.—Three locomotives now being built by the American Locomotive Company and twenty passenger cars under construction by the American Car and Foundry Company are to be shipped to China by the American Asiatic Steamship Company's Braemar, scheduled to sail December 15th. The locomotives, etc., are for use on the Hankow-Canton Railroad, now being built by the American-China Development Company.

Steel Rails to Korea.—The International Mercantile Agency reports: "A feature in industrial lines is the sale of 10,000 tons of Southern pig iron for export to Manchester at \$10 or less a ton at the furnace and a Pittsburgh sale of American steel rails for delivery in Korea."

NEW YORK, U. S. A.

Insisted on Having American Equipment.

THE Tramways Committee of Brighton—one of the most popular South of England seaside resorts—which has from time to time placed contracts for various American electrical equipment, recently disqualified a tender of the British Brush Engineering Company, on the ground that the company has not complied with the specification regarding trucks to be used on the Brighton electric traction system. The Brighton engineer specified for trucks built by one of two concerns in the United States. The Brush people being publicly invited to tender offered to supply trucks constructed at their own works at Loughborough, one of the suburbs of the British metropolis. Not being in accordance with the specification the Brush bid was thrown out. The action of the Brighton Tramways Committee, according to advices just to hand from the other side, has created no little excitement in the British electrical trade. The employees of the electric traction department of the Brush Company passed the following resolutions at a special meeting:

"1. That this meeting, having heard that in several towns it is the custom to exclude British firms from putting in tenders for trucks in competition with foreign makers, respectfully appeals to members of tramway committees and other buyers of cars to give fair play to an industry on which the welfare of so many of their countrymen, not only ourselves and our families, but other workers concerned in the preparation of the material, is absolutely dependent.

"2. That, while having no right or wish to interfere with the actual placing of orders, we urge that in our own country it is unjust that British truck-makers should be barred from opportunities of selling goods which are the product of British labor.

"3. That we protest against any suggestion that foreigners can claim superiority or even equality in any branch of steel work, and we are confident that, with fair and open competition, foreign-made electric traction trucks would soon fail to find any market whatever in this country, and that employment would then be provided for a large number of additional men in this industry."

The incident is interesting as showing the faith that many British purchasers have in the excellence of articles manufactured in the United States and the spirit shown by British workmen in resenting the decision of the purchasing powers. No further comment seems to be necessary.

Peculiarities of an American Inventor.

THE *Implement Age* gravely prints the following about Thomas A. Edison, the eminent American inventor: "He often passes ten or twelve hours at a time in a room from which every ray of light has been excluded. He told the writer that he (*sic*) is so accustomed to doing so, that now, after he has been in the dark room several hours, objects are as distinctly visible to him there as they are ordinarily in the daylight out of doors." Our contemporary also quotes the inventor as follows:

"After I have been in the dark room ten hours or more, I can see to read ordinary print without any other light than that which sifts through solid wood and walls, or emanates from the body. It is wonderful how supersensitive the eyes will become. Prisoners who are locked away for years in utter darkness can see things there as readily as you or I can in the sunlight."

Mr. Edison is so deaf that the discharge of a cannon alongside of him would produce little effect, if any. He is so busy that he does not bother with newspaper people, and when they go to him for stories, after they have shouted their questions into his ear-trumpet several times, in a louder key each successive time, Mr. Edison will say either: "Well, what of it?" or "Who told you so?" If the scribe does not take the hint Mr. Edison becomes so absorbed in other things that his visitor finally melts away. When Mr. Edison has anything to say he writes out a carefully prepared statement and has it published. It is always concise, rational and logical. Up to date he has made no claim to being able to see in the dark, and none of his friends has accused him of remaining in a dark room for ten or twelve hours a day for any purpose. In fact, most of the newspaper stories about Mr. Edison are pure invention, without any merit whatever. Mr. Edison never affirms nor denies a story about him, and for that reason many equally improbable yarns have been printed about him and his plans. Knowledge of this fact has caused THE AMERICAN EXPORTER to exclude from its columns some very interesting but obviously untrue stories relating to Mr. Edison.

Great Stone Cork for Destructive Volcano.

EVERYBODY remembers the destruction of St. Pierre, the chief city of Martinique, in the volcanic eruption of Mt. Pelée on May 8th of last year. Now it appears that an enormous obelisk is being extruded like a yielding cork from the crater of Mt. Pelée. Professor Heilprin of the University of Pennsylvania, U. S. A., has the following to say about it: "Not the least remarkable of the many extraordinary conditions that have been associated with the recent eruptions of the Martinique volcano is the extrusion of the giant tower of rock—a veritable obelisk—which now dominates the mountain, and which has given to it an added height of 800 to 900 feet. This tower of rock issues directly from the summit of the new cone of the volcano to a height of 1,600 feet or more, and virtually plugs it. Where it is implanted it has a thickness of some 300 to 350 feet. From certain points of view the obelisk seems to maintain for most of its height (800 plus feet) a fairly uni-

form thickness; from other points it shows a rapidly tapering surface. In eight days preceding June 7th this growth was, as we have been informed by M. Giraud, 33 feet, and in the four days preceding June 15th (a period within the time of my recent visit to the volcano) it measured 20 feet. The consideration of the depth to which this giant monument descends solid into the volcano would be interesting were there any way of reaching the problem. I noted a feeble line of steam issuing from the absolute apex of the summit, suggesting a continuous passage or channel extending from the base to summit. On March 26th a discharge of incandescent balls was observed also to take place from the same position."

Novel Features of a New Window Shade.

THERE are many cases where it is desirable at times to have a window shade capable of an adjustment whereby the lower part of the window may be screened off and the light allowed to enter through the upper part and at the same time permit of the usual adjustment. Many efforts have been made to arrive at this, but the process has, as a rule, been of such a cumbersome character as to make them almost impractical. An exceedingly simple solution of the matter appears in a shade which has been recently introduced in America and which dispenses with the roller entirely, says the *Philadelphia Record*. This is done by making the shade in three pieces and suspending them in such a novel manner that the admission of light is almost under absolute control. In a general way the position of the three parts is regulated by a cord which is passed through a ring at the top of the window frame and then across to the side, where it passes downward to some point of fastening within easy reach. This controls the raising and lowering of the three parts, as stated. The middle portion remains at any point to which it has been drawn by this cord, while the other two parts are hung with such relation to each other that as one is drawn down the other is raised correspondingly. Thus it will be seen that either the lower or the upper part of the window may be readily blocked off and to any desired extent.

Largest Locomotive in the World.

IN the July issue of THE AMERICAN EXPORTER was printed a picture of the largest passenger locomotive in America. This engine weighed 219,500 pounds. Now a Philadelphia firm has produced a locomotive that weighs 287,340 pounds. It is intended for freight traffic, but the problem of weight has really been what the railroad tracks would sustain. Not long ago it was said to be impossible to run a locomotive that would weigh more than 100 tons, but the one under consideration weighs nearly 150 tons. This new machine is carried on fourteen wheels, and weighs, with its tender and with its tank full of water, 225 tons.

"The power and weight of engines have increased by leaps and bounds," says the *Scientific American*, in describing the new monster of the rails, but the real problem of transportation is not to make locomotives as heavy as possible, but to get the greatest possible strength with the least possible weight. A British scientist says that all our heavy steam locomotives will be on the junk heap in fifty years. It is probable, however, that the junk heap will be doing business with these engines much sooner than our British friend anticipates.

American Electric Cars for Great Britain.—The British Westinghouse Electric and Manufacturing Company, Limited, of which George Westinghouse is president, and in which the Westinghouse Electric and Manufacturing Company of Pittsburg and New York is largely interested, has secured a contract for the equipment of all the cars—about 700—of the Glasgow corporation electric traction system with magnetic brakes. Large contracts have also been taken for similar equipments to be used on the cars of the Leeds and Batley municipal electric lines.

Some New Railway Inventions.—American inventors have recently brought forth some new devices. One enables the motorman of an electric car to move a switch without leaving or stopping his car, another automatically sets the air-brakes on trains and a third provides for seats in ordinary cars that can be converted into beds without any more bother than readjusting the frames much in the same manner as seat-backs are reversed at terminals.

Record Beaten in Loading a Car.—The loading of a thirty-five-ton railroad car with iron ore by steam shovel in the mine in three minutes comes pretty near eliminating the elements of time and manual labor in mining. Dumping ore into a vessel's hold at the rate of sixty tons a minute likewise seems to be about as close as it is possible to get to eliminating waste time. Both these records have been made recently.

Large Contract for American Electric Equipment.—The General Electric interests have secured a contract from the Birmingham Tame and Rea Drainage Board for the complete equipment of the generating station and eight substations and the erection of a transmission line, five miles long, together with the motors and accessories.

Our Woodworking Machinery in Demand.—According to the *British and South African Export Gazette*, there is a brisk demand in South Africa for woodworking machinery, which is being supplied by an American manufacturing concern.

Gain in Exports of Wire, Wire Nails and Pipe.

WE have not mentioned for several months the growth of the foreign demand for American wire, wire nails and pipe lest it might become monotonous to our readers. The returns for October are of interest, as showing the drift of the trade and its increase in volume. Nearly 11,000 tons of wire, wire nails and pipe were shipped through New York and other Eastern ports during the month by the United States Steel Corporation to various foreign countries. The October exports show an increase of some 65 per cent., when compared with similar shipments made in September.

The largest export shipment of wire went to Australia, 3,276 tons in six lots out of the total consignments of 6,826 tons sent abroad in October having gone to the Antipodes. One lot alone represented 1,528 tons. South America was next on the list, 1,421 tons having been forwarded to that part of the globe. Eight hundred and sixty-seven tons in several lots went to the Argentine Republic. To Brazil was sent 326 tons in six shipments, and 228 tons went to Chili in two lots. Four hundred and sixty-two tons were shipped in five lots to South African ports. To Europe 437 tons were shipped in twenty-one lots, practically all of which went to British ports. Mexico took 112 tons in four lots. Other wire exports in October went to Port Limon, Costa Rica; Shanghai, China, and San Juan, Porto Rico.

The wire nail exports aggregated 2,578 tons, as compared with 1,443 tons for September. The shipments to Great Britain and the Far East were the heaviest. To British ports 728 tons were forwarded in thirty-two lots. To China and Japan 622 tons in four lots were shipped. Three hundred and eighteen tons went to Australia in three shipments. To South Africa was exported 206 tons in seven lots. To Continental Europe 183 tons were sent. South America was a purchaser to the extent of 177 tons. Other shipments went to many places.

The pipe exports aggregated 2,396 tons, as against 1,448 tons for September. Europe was the biggest buyer, 1,662 tons going to that part of the world. To British ports 691 tons were forwarded. One hundred and eight tons went in a single shipment to Australia. Mexico was forwarded 118 tons in one lot. Other pipe exports were made to Chili and South Africa.

Large Export Orders for Iron Manufactures.

ORDERS for material from the four quarters of the globe are being filled in the iron mills and workshops in the lower Monongahela Valley, of which Pittsburg, U. S. A., is the central point, and within a few weeks large consignments of machinery and material will be shipped from that district to the remote corners of the earth. The foreign orders to the mills are coming in rapidly, and at no time for the last two years have they booked as many foreign contracts as during the last month.

The Westinghouse Electric and Manufacturing Company has received most of the orders from foreign countries, and machinery and equipment for power and light plants are being shipped to nearly every country from the East Pittsburg Works. The Westinghouse Machine Company at East Pittsburg and the Westinghouse Airbrake Company of Wilmerding also have a large number of foreign contracts on their books, and several shipments have been made to South Africa, the South American countries and other distant points.

The Edgar Thomson Works of the Carnegie Steel Company will soon begin work on a 5,000-ton order of steel rails for a Korean railroad. They only recently finished several large foreign contracts. The Homestead Steel Works of the same company have nearly a dozen orders on the books for ship plates for boat builders in England, Ireland and Scotland, and a large order for pipe plate for Australia. The Standard Chain Company has just completed an order for merchant chain for Brazil and the Argentine Republic.

The Rankin plant of the American Steel and Wire Company is working on an order of field fencing for South Africa, and bath-tubs are being shipped from the McVeigh & Walker plant, in Braddock, to the Philippines and China.

Nearly every manufacturing plant in Braddock, Homestead and other towns in the Monongahela Valley has foreign orders booked.

Foundry Exhibit at the American World's Fair.

PRESIDENT ENGLER, of the Worcester (U. S. A.) Polytechnic Institute, recently had a conference with a number of leading foundrymen from different parts of the country respecting the building and exhibit which the latter purpose to have at the St. Louis Exposition next year. It is proposed to erect and operate a model foundry, fully equipped with all necessary apparatus and exhibiting in operation all the processes of modern foundry practice. An advisory committee has been appointed to organize the work, and of this committee President Engler is a member. The Worcester Polytechnic Institute has been invited to prepare complete plans for the building, having in mind special reference to ideal conditions as to light, heat, ventilation and sanitation, and to a maximum of economy and efficiency by convenience of arrangement and use of the best modern devices in machinery and methods. Besides furnishing space for all ordinary operations in iron, brass, aluminum, steel and lead, the building is to provide accommodations for a chemical laboratory, an exhibition room, a library and reading room, etc. This foundry exhibit is designed to be primarily educational in its character, and during the entire time while it is in operation in St. Louis it will be under the direction and charge of the Worcester Polytechnic Institute.

Demand for American Farm Tools.

THE *Farm Implement News* sums up the reports of the United States consuls on our agricultural implement trade abroad, summarized in recent issues of THE AMERICAN EXPORTER, as follows: "Generally American consuls report that the use of modern labor-saving farm implements and machines is increasing in all foreign countries where agriculture is of any importance, and the American machinery takes the lead whenever it has been properly introduced and looked after. In countries where little manufacturing is done its introduction is favored and aided by the governments. In countries where the manufacture of implements is carried on to any considerable extent the governments seek to protect their manufacturers by the imposition of duties, more or less heavy, on foreign products, and particularly on the American. Our best trade, however, is with the countries most protected, for the reason that a demand large enough to be worth protection will seek the best machinery and will take it largely, though of foreign make and burdened by high duties. Foreign farm machinery does not come into the United States, whether our duties be high or low, because it is inferior and there is no demand for it here; but our farm machinery is in best demand in the most progressive agricultural countries and gets there over tariff walls made especially high to keep it out, and would get there in much greater quantities if those walls could be lowered or removed by reciprocity agreements."

Our Implement Trade with Africa.

UNDER recent date a London correspondent says: "Although trade in the implement business is dull throughout the United Kingdom, there is every indication that it is brisk in South Africa. The latest advices speak well for the future. The value of the imports of implements into Cape Colony for the first three months of the year, contrasted with the same period of 1902, was £102,000, against £25,000. For the Transvaal (in this case the figures include machinery and metal goods) the value was £1,215,000, against £500,000, while substantial increases are noticeable for the other adjacent colonies. This increase has been in steady progress for months, indicating a healthy return to normal conditions. A keen observer has been over the whole field and he finds that in several branches of the implement and machinery business American makers have made a favorable impression on the native farmers for the excellence of their goods."

The correspondent speaks of the demand for American plows as being greater than for those of British make. He says: "In the Orange River Colony and in the adjacent colonies the United States plows are the most frequently seen, the reason being that they are lighter, just as strong, less complicated and well adapted to the undulating nature of the land. Steam plows, too, have been successfully introduced into the Transvaal."

Gasoline Engines for Marine Uses.

AT the recent convention in New York of the American Society of Naval Architects and Marine Engineers an interesting and timely paper was read on the subject of "Gasoline Engines for Marine Propulsion" by D. H. Cox, formerly a constructor in the navy.

"The development of the automobile having demonstrated the possibilities of explosive gasoline engines for vehicle propulsion, their application to marine work has followed as a matter of course," he said. "While the many troubles and accidents that have been experienced by the majority of automobilists have tended to prejudice the minds of many persons against these engines, this should not really be the case. Rather should it be considered decidedly to the credit of an engine of its type that it has been able to be used with any degree of success for automobile work."

"The heat produced in the cylinders from the high temperatures of the exploded gases can, in the marine motor, be readily drawn off by an unlimited supply of circulating water, while in the automobile the cooling effect of the air must be relied on. The dust and grit, with their disastrous effects upon automobile engines, are not to be contended with. The conditions of use are more severe for the automobile."

Foreigners Now Buying American Steel.

COMMENTING on reports in THE AMERICAN EXPORTER regarding the change in the movement of steel, whereby our importations are declining and our exports are increasing, the *New York Times* says editorially:

"In view of the widespread interest taken in the outlook for the iron and steel industry, the announcement that 100,000 tons of American steel have just been ordered by Welsh tin-plate makers will be read with considerable attention. This is quite the most important development in our steel trade that has come to notice in a long while past."

A New Power Hammer.—A new power hammer has been invented by William R. Jenkins, of Bellefonte, Pa., U. S. A., the object being to provide means whereby the force of the blow or stroke of the hammer can be readily controlled and adjusted to the work in hand, without any change in the speed of the hammer, as is the case with power hammers ordinarily employed. *Modern Machinery* gives an interesting description of the device.

Without doubt, America's most famous Bottled Beer—manufactured from the purest and best materials known to the Brewing Art. Absolutely no beer in the world its equal in merit.

ST. PAUL, MINN., U. S. A.

Owners and Manufacturers of

Bohn's Patent Dry Air Syphon System of White Enameled Refrigerators.

The Bohn Dry Air Syphon System insures a low and uniform temperature, ranging from 38 to 48 degrees Fahrenheit. With our Enamel Lining, you need only to wipe the food compartments with a damp cloth to clean perfectly. The only absolutely sanitary refrigerator made.

Adopted and used exclusively by the Pullman Company for all of their Dining and Buffet Cars. Pennsylvania Lines, New York Central, Michigan Southern, Union Pacific, Canadian Pacific and all other railways throughout "the States" and Canada as well as by thousands of homes, hotels and clubs.

For Foreign Markets Only.

The prices here quoted includes boxing ready for transportation and delivered F. O. B. cars at New York City.

No. 2. Style "A." Panel Door. Price, \$23.00. Outside measurements (inches): Width, 38; depth, 21; height, 44. Weight, boxed, 278 pounds.

NOTE.—Orders received direct, or through export commission houses. When ordering through the latter, to avoid errors, please mail us a duplicate of order.

Our forty-page catalogue, illustrating and describing the various styles of White Enamel Refrigerators made by us, mailed postpaid.

No. 2. Style "A." Panel Door.

No. 3¼. Style "D," Panel Doors.

From Milk to Butter in ONE Minute.
NO CREAM SEPARATOR NECESSARY.

The use of the "One-Minute Churn" assures to private families **fresh, pure and wholesome butter at all seasons of the year**, doing away with tainted and poorly manufactured butter.

EXPORT ONLY.—Upon receipt of **Thirty Dollars (\$30.00)** in U. S. Gold, or its equivalent, we will box, ready for shipment abroad, one of each, seven in all, of our "One-Minute Churns" as follows:

Size A,	Industrial Miniature, capacity	1 quart
Size No. 1	(Special Household Size) "	1 gallon
Size No. 2	" "	3 "

BRENNAN MOTOR CO., Syracuse, N.Y., U.S.A.

Growth of Exports of Boots and Shoes.

LAST month we published United States Government statistics showing the increase in our export trade in boots and shoes. The New York *Times* follows up the subject with some interesting information, including the fact that the gain since 1893 is nearly 1,200 per cent. It says in part: "Exports of American shoes are increasing, but experts who are familiar with conditions of the trade here and abroad say that only a beginning has been made by the domestic manufacturers in getting foreign business, and that fields of untold wealth lie open to those who are energetic and enterprising. It has been computed that the boot and shoe factories in the United States have capacity sufficient to supply, by six months' continuous operation, all the footwear required by the domestic trade in a year. It is argued that if the volume of foreign orders were sufficient to keep the factories running in the seasons of the year when the home trade is dull there would be an enormous gain in wages to employees, who are now idle a large part of each year, and in additional profits to the manufacturer."

George C. Hardin, who has traveled in South America and the West Indies for years selling shoes, said of the increased business:

"In 1892 I was the only American going out to sell shoes to the British West Indies. This year, while I was in the islands, I met seventeen other salesmen from New York and Boston. The people in South America and the islands are about a year behind us here in styles. Salesmen in this country are now taking orders for next fall. After Christmas I will start for the South to get orders for boots and shoes that the factories will make next year. By that time the domestic orders are in and the trade knows what styles will be popular. There is a decided advantage for the manufacturer in the way the South American trade follows the domestic development. There is not much demand in the West Indies for new styles. I carry now about half of the same samples I took with me the first time I went there. One of the best-selling shoes in South America is the Brut Tamer. The Creoles gave this name to the shoe, and certain manufacturers who add an 'e' to the Brut are in error. This shoe is sold at 85 cents in America, \$1.20 at wholesale in the Southern countries and about \$1.44 retail. There is also an increasing demand for the finer American shoes."

Das Handels Museum, an Austrian trade paper, says on the subject:

"Attempts are now being made to form a trust of the German leather manufacturers. As a preliminary step a central office will be located in Berlin and the members of the trust will be assessed about 75 cents per employee for its maintenance. Statistics show that German exports of shoes have fallen off, and that imports of American shoes are rapidly increasing. Americans are opening stores in all the German cities."

\$100,000,000 for American Canals.

IT looks as if the waterways of the United States, natural and artificial, are about to obtain the position in the public mind that the commerce of the country justifies. Last month the State of New York voted \$100,000,000 to deepen and widen the Erie Canal by an overwhelming majority, and work on the canal will soon begin. That the action of the recent New Orleans waterway convention will have a far-reaching influence favorable to the improvement of the Mississippi and Ohio rivers, together with the latter's important tributaries, there can be no doubt. The convention was composed of strong men, influential in the various sections they represented, many of them men of national fame. Therefore, when a body of such men, representative in every sense, makes a demand upon Congress to improve the nation's two great inland waterways, the Ohio and the Mississippi systems, the demand must receive consideration. The convention was one of the largest, dignified and conservative ever held in the Mississippi Valley. The joining of the Ohio improvements to those of the Mississippi was the most important result of the convention. In its unimproved condition the Ohio is the greatest freight-producing inland system in the world. When it is improved from Pittsburg to Cairo, it will carry to New Orleans and from thence to the markets of the world a tonnage surprising in its magnitude. The result will be that the Gulf of Mexico will become a great harbor of the United States and New Orleans one of the greatest export cities in the country. The general effect of all the improvements planned will be advantageous not only to domestic trade, but to our foreign commerce as well.

Foreign Shoemakers Come to America.

THE growth of the shoe manufacturing industry in America has kept pace with the development of the country to an extent that has brought about an influx of foreign workmen. The city of Lynn, in the State of Massachusetts, is one of the centers of the industry, and a correspondent in that city has the following interesting comments to make on the situation: "The rapid increase in the demand for help in the shoe factories of Lynn has brought to the city a cosmopolitan population very marked in its distinct elements. Some years ago the influx began with the coming of the French-Canadians, who came by progressive stages through the mill towns of the States of Maine and New Hampshire to the cities of Lowell and Lawrence and gradually overflowed into Lynn. To-day there is a French population of over 1,000, and they constitute a very respectable part of the people, having a church and parochial school and several fraternal societies.

"Later have come the Armenians, Greeks and Italians, until now there are hundreds of the dark-skinned natives of southern Europe busily employed in the best shoe factories. Many of these foreigners come direct to Lynn from the vessel which brought them to this country. They are taken in hand by friends who have preceded them, and given instruction in the easier parts of shoemaking, proving to be apt pupils and are very soon able to take a place and earn their own way. They live cheaply and save their money, being little inclined to go about the barrooms. They rapidly improve in their workmanship until they are advanced to the best work, and now some of the finest shoes are turned out by Armenian and Italian workmen. It is noticeable that they are eager to acquire the English language and the evening schools are attended by a large number. Many of them have sent for their women-folks, and hundreds of happy homes have been the result."

Technical Education Benefits Export Trade.

THE great influence of technical education in developing industries, increasing export trade and augmenting a country's wealth is shown by a report which the British Consul at Stuttgart lately sent in to his Government concerning the technical high schools of Germany. There are nine such created and conducted by the Government; two more are now being established. Besides these state institutions many others under private management, but subject to governmental supervision, exist in Germany, which turn out able engineers and scientifically educated craftsmen. The British Consul points out that Germany, in consequence of its thorough and widespread system of technical education, has surpassed within the last fifty years all other nations, and now holds first place in chemical manufacture. He estimates the value of the chemical products annually made in Germany at 1,000,000,000 marks, or \$238,000,000. A very large part of these (especially dyes made of coal tar) are exported to the chief manufacturing nations—the United States, England, Belgium, France, etc., as also to China, Japan, India, etc. There is scarcely a country in the world which does not use German chemicals of some sort. The transformation of Germany from a poor agricultural country to one of the first and richest manufacturing and exporting nations is, to a considerable extent, due to German superior technical training. Some of the German chemical works have branch establishments in foreign countries. The German capital invested in these earns big profits and adds to the national wealth of the country.—*Modern Machinery*.

Wonders of the American State of Oregon.

PROBABLY no country in the world is so rich in natural resources as ours that is at the same time so sparsely settled. The diversity of agricultural possibilities is continually being shown by successful experiments, and the richness of the river valleys beggars description. The Pacific Northwest is preeminently the wonderland of production on the continent. William Macleod Raine, in *Pearson's Magazine*, tells how a farmer in the Hood River country raised on four acres 800 bushels of potatoes, that nearly all ran from three to eight pounds apiece. There was not in the lot one that weighed less than a pound. Squashes weighing as much as a large man, pumpkins tipping the scale at the hundred weight, watermelons larger than the Southern pickaninnies, whose eyes would bulge at seeing them; turnips larger than one's head, pears and apples with a circumference of half a yard, are to be seen at the annual fairs of Salem and The Dalles. The biggest apples, the biggest pears and the biggest cherries at the Chicago Exposition were from Oregon, and the charge cannot be made against them that what they gain in size they lose in flavor. The Pomological Society, which is the highest authority on fruits in the country, awarded to the State of Oregon the Wilder Medal for the horticultural exhibit at the Pan-American Exposition. The "Web-foot State" stands first in the production of hops, raising about one-third of the country's total production. So far as is known, there is no spot on earth, with the exception of eastern Oregon and Washington, and the adjoining valleys of Idaho, where three or four crops of wheat may be harvested from one sowing. Yet since the first settlement of the country these "volunteer" crops have been reaped. A second crop from a single seeding is officially reported to have yielded thirty bushels to the acre.

Deodorizing Petroleum Products.—The increasing use in America and other countries of the naphtha engine, whether in motor vehicles, in launches, or elsewhere, makes the question of the deodorization of petroleum products a serious one. M. Charles Henry has indicated a method of deodorization which is very practical, being both rapid and cheap. To 220 pounds of petroleum he adds 44 pounds of water, $3\frac{1}{2}$ pounds of massicot, or lead oxid and 20 pounds of caustic potash. The whole is shaken for about an hour and then decanted. The oil thus treated will be absolutely inodorous.

If Coal Is Costly, Then Burn Mud.—Several American inventors have been trying to find substitutes for coal. Edward Atkinson, of Boston, has invented a method of making mud bricks, which, he says, are equal to Irish peat. Professor Norton, of Harvard, recently tested these mud bricks and found that they gave out a clear, strong flame and two-thirds as much heat as the same weight in coal. Dr. R. J. Schrimper, of St. Paul, has invented a brick that is made out of soft coal refuse. It is said to cost less and to give out 50 per cent. more heat than soft coal.

"A TWENTIETH-CENTURY MARVEL IN WASHING MACHINES."

GUARANTEE WASHER.

THE **Guarantee**

FOUR-STROKE ROTARY

Washing Machine

Just placed upon the foreign and home markets, combines the **Latest Improvements in High-Speed, Ball-Bearing Washing Machines** and will accomplish all that is claimed for or required of any washing machine, and more.

NOT A SPECULATION BUT AN INVESTMENT, the returns of which will pay you ONE HUNDRED (100) PER CENT.

GUARANTEE WASHER.

FOR TWENTY DOLLARS

in U. S. Gold, or its equivalent, we will crate, ready for steamer and deliver f. o. b. cars at New York City, **Four (4) Guarantee Four-Stroke Rotary Washing Machines.** (Retail in the United States of America at ten dollars each.) Weight, three hundred pounds. Order **FOUR NOW.** Later you will order in large quantities.

MICHIGAN WASHING MACHINE CO., Mfrs., Muskegon, Mich., U. S. A.

Also makers of the world-known "Muskegon" and "Michigan" Washing Machines, over 250,000 of which are in use throughout the United States.
NOTE.—When ordering through export houses, to prevent mistakes, please mail us a duplicate of your orders.

Indelible
TRADE MARK

**NON-GREASE
TYPEWRITER**

RIBBONS & CARBONS

We manufacture the largest variety of Carbon Papers and Ribbons made by any one concern. 100 varieties to choose from in Typewriter, Pen, Pencil, Stylus and Railroad Carbons. Write for catalogue and export prices. Orders received through any New York exporting house at export rates.

A REMARKABLE RECORD!!!

Commencing in the year 1900 to manufacture the "1900" Washing Machine, we at that time "turned out" an average of **Five Washers per day.** During the month of August, 1903, we manufactured and sold **OVER FOUR HUNDRED Washers per day.**

A REMARKABLE RECORD!!!

REWARD OF MERIT!!!

REWARD OF MERIT!!!

The "1900" Ball-Bearing Washing Machines are the embodiment of the results obtained from over twenty-one years' practical experience in the making of washing machines, and, unlike any other washer upon the market, **do not tear and wear the garment,** but by the adoption of our **agitator** tosses and tumbles the garment through a **whirlpool of water,** thus forcing the water through the **finest or coarsest fabrics,** causing the clothes to become **ABSOLUTELY CLEAN,** without boiling or scrubbing, without wear or tear, and without the use of chemicals.

SPECIAL OFFER FOR FOREIGN MARKETS ONLY:

\$22.75

Upon receipt of **Twenty-two Dollars and Seventy-five Cents** in U. S. gold, or its equivalent, we will box, ready for steamer, and deliver F. O. B. cars at New York City, **One of Each (Four in All), "1900," "1900 Junior," "Domestic" and "Home" "1900" BALL-BEARING WASHING MACHINES.** Weight of the four machines, boxed 300 pounds.

To facilitate our increasing export trade we desire to communicate with one responsible business house in each trade center of the world.

Tens of thousands of the "1900" Washing Machines have been sold in the United States, as well as in all parts of the world. Many of our agents at home are making over \$200 per month. Live men in your vicinity can do as well.

Orders received direct or through export houses; when ordering through the latter, to avoid errors, please mail us duplicate of order. Our Illustrated Catalogue mailed postpaid.

Big Apple Shipments to Foreign Markets.

THE shipment of American apples to European markets this season has been greater than ever before, having passed the 1,000,000-barrel mark October 17th, a record never before equaled at such an early date. Last year, which was one of the best ever known previously in apple exports, the million mark was passed on November 8th, three weeks later.

The farmers find it exceedingly difficult, not only to get their apples in before the heavy frosts, but also to secure barrels in which to pack their product for the foreign market. According to the testimony of one person, who has been visiting in the State of Maine, some of the apple-growers were obliged to send ten and fifteen miles for barrels, and then carry back one manufactured of wood almost in its green state, correspondingly heavy.

Freak apples are found quite frequently. The other day a Miss Lena Sinclair, of Hallowell, took to a newspaper office a large apple, the upper half of which was a rich russet color and the lower half a deep red. It looked as if two apples of different varieties had been halved and the upper half of one joined to the lower half of another.

The New York Times gives the following additional information: "American apple exports this season are almost 2,000,000 barrels, the largest quantity ever known, and there seems to be no cessation in the demand. Short crops in England and all over Europe are responsible for the unusual demand. Exporters say that nothing in their advices indicates any reduction in demand, and they are arranging to handle quite as many apples in the next few weeks as they have during the past month. During the week closed November 21st enormous quantities went across. According to statistics compiled by W. M. French, one of the largest apple exporters in the world, the figures were: From New York, 60,945 barrels; Boston, 67,077 barrels; Montreal, 73,092 barrels; Portland, Me., 10,483 barrels, and Halifax, N. S., 19,500 barrels. Of this quantity Liverpool took 113,332 barrels; London, 46,443 barrels; Glasgow, 28,109 barrels; Hamburg, 20,862 barrels; Hull, 5,326 barrels; Paris, 653 barrels; Antwerp, 1,161 barrels; Bremen, 316 barrels; Copenhagen, 250 barrels; Bristol, 6,877 barrels, and Manchester, 7,768 barrels, a total of 231,097 barrels, the largest week's business in the history of the export trade."

American Fruit Sent to the Far East.

IN our issue of last June we gave some account of an extremely interesting experiment made in the matter of shipping American fruit across the Pacific Ocean to the Far East. We understand that the experiment was successful, and a correspondent at Santa Clara, in the State of California, sends us the following regarding a similar experiment:

"The possibility of shipping fresh fruit to the Philippine's and Asiatic ports from the United States has been demonstrated by a successful shipment sent by S. W. Charles, of Palo Alto, from the packing house of A. Block, of Santa Clara. The shipment was made on the transport Sherman in cold storage, and the fruit was five weeks in transit. The fruit selected was from a lot being prepared for the London markets and included one box of white Astrakhan apples, one box of plums and one box of Bartlett pears. Mr. Charles wrote to his relative, Allan E. Peck, assistant surgeon at Manila, notifying him of the shipment and asking him to send full particulars of the condition of the fruit on arrival. A reply has been received, indicating that the fruit arrived in almost perfect condition. The apples were sound.

"They took the army officers off their feet," remarks the correspondent, "and my quarters were besieged until they were gone. The apples we get are small and inferior in quality, coming from Australia with the large meat shipments from there. However, they sell at 10 to 25 cents each."

"The plums also were in perfect order. Of the pears four or five were a little past the point of ripeness. The rest were excellent and without a flaw. Refrigeration was not perfect, as the fruit was with the stores for the transport service mess. The frequent withdrawal of supplies for use on board the ship caused a loss in refrigeration. With complete refrigeration fresh fruit can be, no doubt, successfully marketed in the Philippines."

War Gave Bicycles a Boom in Africa.

ONE of the changes brought about by the war in South Africa has been the increased use of bicycles. A correspondent writes as follows on the subject: "A few years ago the horse was employed, without exception, by Boer and Briton alike for riding purposes. A serviceable horse was an absolute necessity, and men of means had several. The pride of a Boer in those days was a horse. It almost came before his 'vrow.' Most of his time was passed in the saddle riding to the nearest town, often several miles distant, and visiting neighboring farmers on business and pleasure bent. Much the same necessity existed in those days for the Britisher to keep some horses. Mining ventures were often far from towns, and stores, which were principally run by Europeans, were away from settlements. Now the bicycle has to a large extent taken the place of the horse.

"It would hardly be believed what primitive sandy roads it is made to travel over. Often it can be seen bumping over the veldt itself, or gliding along some narrow Kafir footpath. There are several Boer families living around me belonging to the poorer class of farmers. The men all, without exception, use the bicycle in place of the horse. When questioned on this they

state that the bicycle is cheaper, quicker and more to be depended on. Horse sickness, one of the curses of the Transvaal, every season carried off their horses until they were completely crippled by this annual drain on their purses. One of these Boers told me he had had his machine for seven years, riding it to town daily, and, with the exception of new tires, it had not cost him a penny since the first outlay. If I look along the valley at sunrise or sunset I can pick out a string of little figures perched on their machines riding to their work in Pretoria and returning home. It is five miles to town from here, and it takes them but twenty minutes, notwithstanding the heavy sand in some parts. On a horse it would take double this time, and then you would have to feed and stable it. These Boers soon become expert and fearless riders, and equal their splendid horsemanship; though, dressed in their rough suits, they do not present a very natty appearance.

"But if one wants to realize the universal use of the bicycle one must go to Pretoria or other towns. On the 'stoeps' of the private house at meal hours there are always three or four machines standing against the rails. Outside the eating houses dozens can be counted, and in the yards of the Government building stacks of them are piled, belonging to the clerks at work within. The streets are full of them, many of the riders being ladies and school children, and not a few Kafirs. Of these latter some are mounted on their masters' machines, while others have their own. In fact, all and every class has a bicycle, not only in the towns, but to a great extent throughout the country. A man who is not a cyclist is so rare that you might ask a hundred if they rode and not come across a non-rider. One has only to take a stroll around Pretoria and count the cycle shops and agencies to gather a good idea of the extent of the demand. Many of the best English makers are represented, and, of course, American machines are stocked. A useful bicycle can be purchased nowadays for about £12, and a first-rate wheel, with all the latest improvements, from £16 to £30. Still, when all is said, it is strange that the bicycle should not have ousted the saddle-horse."

Wonderful Woods of the Philippines.

AMERICA'S new possessions in the Far East are constantly showing the wisdom of the acquisition of the archipelago. The value of the woods in the Philippine Islands to many branches of industry is very great, for they possess qualities unknown to our own. A correspondent of the *Modern Machinist* says that one of them is an exceedingly fine-grained, tough wood, very useful for tool handles, while another seems to be a cross between wood and iron, for it is very heavy and resistant, so much so that the natives use it for spear-heads. It can be readily worked by tools and has a metallic ring. In some cases it is wrought to shape by emery wheels. Another species is a close-grained, tough wood, which seems to be a dyewood, for when immersed it stains the water bright yellow for a long distance around it. This wood is also quite heavy and takes a fine finish. American lumbermen call it "yellow jack." Still another wood is called "belang" by the natives, and white wood by American lumbermen, but is quite different from our own wood of that name. It can only be worked by very sharp tools, but has a veined surface when finished, and is capable of taking a high polish. The business of preparing these woods for American markets is going forward with despatch and it is said to be very profitable.

Effects of American Manufacturing Skill.

COMMENTING upon the foreign trade of the United States, the New York World says editorially: "A decrease in the importation of luxuries is noted. Is not the cause to be found in a national development of skill in craftsmanship which is putting us ahead of Europe in the production of such articles? It is certain that American-made jewelry has attained a perfection of form and finish which renders it superior to the foreign product. Of two articles of jewelry made along similar lines the American not only in many cases appears more artistic, but it now possesses an intrinsic value which makes it the better purchase. Not only is it manufactured on a closer margin of profit, but in its retail price no trans-Atlantic freight is reckoned or broker's charges. In glassware, silverware, cutlery, clothes, shoes, we excel. In multifarious lines of manufacture America can truthfully utter the bird-o'-freedom boast that she beats creation. And this, notwithstanding, that there are peasant women on the plains of Asia who can weave a more beautiful rug than any carpet-maker the world over can manufacture. It is the survival of an individual trade such as this in full flower which keeps the conquest of machinery from being complete."

Pneumatic Oil Can.—An American inventor has designed an oil can which does not have to be lifted when a lamp is to be filled. It has a pneumatic pump located on the top of the can and connected by a tube to an air-tight compartment below, which is formed by inserting a partition in the can near the bottom. Surrounding the tube, where it passes through the partition, is a valve, through which the oil can flow into the lower compartment. As soon as the rubber bulb is compressed to force air into the lower compartment the pressure closes this valve and drives the oil upward through the pipe leading from this compartment to the exterior of the can. There are no vents to open to permit the inflow of air to replace the oil removed, and no valves to be opened or closed. All that is necessary to do is to place the lamp to be filled beneath the outlet and give a few compressions on the rubber bulb.

ANIMAL TRAP CO.,

ABINGDON, ILLS., U. S. A.

The Largest Manufacturers of

MOUSE, RAT AND GAME TRAPS IN THE WORLD.

Particular attention given to export orders. Illustrated catalogue free, giving full particulars. Order through your Exporter.

Freer Trade with Canada.

IF the recent Alaska boundary decision did nothing else, it gave the Dominion of Canada an extremely good advertisement, as we sometimes say in America. The resentment shown by many people in the Dominion called attention to the country and aroused interest in it not only in the United States, but in the dependencies of Great Britain elsewhere in the world. Canada has been very quiet for years, and in our British exchanges we have read column after column about South Africa, Australia and India, where Canada, if mentioned at all, was dismissed with a brief paragraph. Canada seemed to have been almost forgotten except by the export merchants of the United States who do business with her traders. The newspapers in the United States also have awakened to the importance of our neighbor on the north and we feel safe in asserting that Canada's defeat in the Alaskan controversy was the best thing that ever happened to the country. A writer in *Collier's Weekly* contributes the following information about the trade relations between Canada and the United States, which is at variance with popular belief in some respects, but which we are assured by the editor of the paper is founded on careful investigation:

"Canada is not only our third best customer, but, in proportion to population, our very best. In the fiscal year ending June 30th Canada bought from this country merchandise to the value of \$126,000,000. That makes an average of more than \$25 for every man, woman and child in British North America. In the same period the purchases of the United Kingdom, our largest customer, amounted to only about \$12.50 per capita. This was despite Canadian preference of 33 1/3 per cent. to British imports, and despite tariff obstacles which kept Canada's sales to the United States down to about one-third of the value of goods bought from us.

"There is a growing sentiment along our northern border that this Canadian market is worth more consideration from American lawmakers. It is argued that a good customer should be treated with conciliation and friendliness, not in a spirit of contempt or of hostility. That is the rule in private business. Why should it not be in national business? ask the merchants and manufacturers of the National Reciprocity League, whose membership extends from Maine to St. Paul. In 1898, when the Joint High Commission of British-Canadian and American representatives met at Montreal, the first question on its list was trade reciprocity, while the obstacle which prevented an agreement was the Alaska boundary, now settled.

"Our tariff against Canada is illogical in many ways. Canada is now a great wheat-producing country. Following the natural course of trade, Canadian wheat should come to the American mills at Minneapolis and other cities to be ground. It is turned back by a tariff of 25 cents a bushel. The duty does not affect the price of American wheat. That is fixed in Liverpool. Canadian lumber comes in under a high duty, which raises the price to American home builders. On the other hand, American manufacturers are being forced to build branch plants in Canada because of the tariff barriers.

"New England already has the benefit of free coal from Canada, although the law removing the duty is only temporary. But what reciprocity especially means for New England is a greatly enlarged market, close at hand, for her immense manufactures of boots and shoes, cotton and woolen goods and other products of her ever-busy factories."

Nearly \$200,000,000 for the Panama Canal.

NOW that the completion of the Panama Canal is certain to be a matter of immediate progress—there was never any doubt about its ultimate construction since the United States Congress took action insuring the consummation of the plans of its originator—it is interesting to note what it will cost the United States to give this important waterway to international commerce. It is estimated that it will cost the American Government \$184,233,358 to acquire and complete the canal, besides the amount to be paid to the government in control of the isthmus for the concession. Already there has been an immense amount of money and energy expended on the canal. It is safe to say that a sum more than sufficient to dig a waterway from ocean to ocean at sea level has been collected from investors at different times in its history.

When De Lesseps organized the first company in 1880 for the construction of the canal, it started work with a paid up capital of \$60,000,000. For eight years the company toiled, employing at times as many as 15,000 men. Then came a necessity for changing the plans and the company failed, after having collected in round figures from the sale of stock and bonds \$260,000,000. Of this it was shown that the expenditures actually made on the isthmus amounted to \$156,400,000, and that the cost of excavation and embankment proper was \$88,600,000. The ultimate cost was then estimated as \$174,600,000. For several years an effort was made to capitalize a new company to complete the work, and at last, in 1894, the present Panama Canal Company was organized, with a paid up capital of \$13,000,000. Since that time work has advanced at the rate of about 1,000,000 cubic yards of excavation each year.

The total amount of excavation up to the present time has been about 81,000,000 cubic yards. Unfortunately, only about 40,000,000 cubic yards of this is available for the waterway proposed in 1899-1900 by the Canal Commission, of which Rear-Admiral Walker, U. S. N., was president. The Walker Commission's recommendations included this available excavation in the \$40,000,000 to be paid the canal company for its work, maps, records,

drawings and the property of the Panama Railroad Company. The commission estimated that the total amount of excavation which would be required for the canal to be built from its plans, exclusive of that for the Bohio dam and the Giganti spillway, would be 94,863,703 cubic yards. The work remaining to be done, therefore, represents the difference between the amount of available excavation which it will acquire by purchasing from the Panama Canal Company, or nearly three-fifths of the entire work. It is estimated that the cost of the work will be \$144,233,358, in addition to the sum to be paid to the present owner of the property. By the time it is completed more than \$450,000,000 will have been obtained in one way or another for use in building the canal, while nearly \$312,000,000 will have actually been spent in connection with its construction and administration.

It was the intention of the Panama Canal Company to make the canal 29.5 feet deep. The increased dimensions of steamers now being built has made it necessary to plan for a much deeper canal, and the Walker Commission's plans are for a waterway 36 feet deep.

American Rice Association Asks for Reciprocity.

AMERICA'S foreign rice trade is constantly increasing and the merchants engaged in it are determined to use every effort to gather further gains.

The Rice Association of America, in session last month, adopted resolutions declaring in favor of the Cuban reciprocity treaty and asking the United States Congress, in all reciprocity treaties with Cuba and Central and South American countries, to provide that rice be admitted to these countries. It had been decided originally to send a delegation to Washington to lay this matter before Congress, but the Rice Association decided that this was unnecessary, and that the submission of the resolutions to the Ways and Means Committee would be sufficient. The resolutions call attention to the fact that in eight years the rice crop of this country has increased fivefold, and say further:

"The production of rice in the United States now equals the consumption and gives employment and support to more than 1,000,000 people. The growth of the industry in the future must depend largely upon our ability to secure outside markets. Porto Rico has been of great advantage to us, purchasing annually from us large quantities of low-grade rices. The Hawaiian Islands have been regular purchasers. In Cuba there is, prospectively, an annual market for about 100,000,000 pounds."

Possibilities of the Trade in Diamonds.

NOW that the English papers are prophesying a return to the early Victorian styles of dress we may expect even a larger demand for diamonds for watch-guards and buckles and other paraphernalia of the dandy. At present more than 90 per cent. of the world's output of diamonds is controlled by the De Beers Company, of South Africa. Says the *New York Sun*:

"How much longer the Kimberley properties will continue to yield is not known. A suspicion is abroad that they have seen their best days. If this be the fact, a question arises regarding the source of future supply. The new Premier mine, near Pretoria, continues to present highly encouraging reports. A stone of 280 carats weight is a recent announcement. So long as people continue to pick up specimen stones, as they do, in different parts of South Africa, there remains the possibility that some part of that area will succeed the present workings as the future reservoir for the gem market. But it is not yet reported that the De Beers stockholders are losing any sleep because of any anxiety about the Kimberley mines. Yet if the American people grow ever more and more hungry for the white sparklers it will become an economic necessity for somebody to locate new and liberally yielding diggings. The expenditure of \$30,000,000 a year buys a heap of diamonds."

The Age of Industrial Wars.

IN the industrial battle fought between nations the most important weapon is an intelligent man technically educated. This has been acknowledged in Germany for twenty years, in the United States for fifteen years, and it is now being acknowledged in England. I think that this is true. Any nation that can put on the market a product cheaper than any other nation will sooner or later have the monopoly of the sale of that product. In national politics, tariffs and subsidies may, for a time, give a temporary advantage to one nation or the other, but in the long run it is a question of cheap production. The cost of production depends on two things—the availability of raw materials and the brains of the people who develop that material into finished products.—*The Engineering Magazine*.

War a Bad Game.—The *Shoe and Leather Gazette*, after quoting the gains in our export trade already printed in THE AMERICAN EXPORTER, makes the following comment: "It is quite evident that of all possible wars in which we could engage, a war with England or Germany would bring the most of 'hell' to the people on both sides. Nations so mutually interdependent cannot afford to quarrel. It has been said that 'War's a game which, were their subjects wise, kings would not play at.' It is safe to say that there is sufficient wisdom among the 'subjects' in all three countries to restrain the rulers, especially since the 'subjects' do most of the ruling—for both England and Germany are in reality republics, in most important essentials."

Patented
in All
Countries.

CARY'S UNIVERSAL BOX STRAPPING

Made of soft steel through which nails can be easily driven.

Put up in coils of 300 feet and packed 20 coils in a case.

Made in four widths, viz.: $\frac{1}{2}$, $\frac{3}{8}$, $\frac{3}{4}$ and 1 inch.

SKELETON AND TWISTED PRONG FASTENERS.

MADE IN VARIOUS SIZES.

PROTECTIVE SEAL
For Wine Cases.

CARY MFG. CO., 19 & 21 Roosevelt St.
NEW YORK.

CABLE ADDRESS: "CARLEIO."

Before Using
SMOOTH-ON Castings.

After Using
SMOOTH-ON Castings.

In ordinary foundry practice many iron castings are rejected which could as well be saved. Their strength is not affected by blemishes; the only reason for dumping them on the scrap heap is their appearance.

SMOOTH-ON is not a mere filling. It is a dry, metallic composition, which, upon being mixed with water, becomes a hard metallic iron that is insoluble in water, petroleum or other oils; that will stand an intense heat; and the expansion and contraction being the same as iron is why it is sometimes called Magic iron. When applied to a blemish in a casting by a skilled mechanic, the blemish is removed.

Write for our 60-page Illustrated Book, telling about the different Smooth-On Cements and their uses. Sent free.

SMOOTH-ON MFG. CO.

572-574 Communipaw Ave., Jersey City, N. J., U. S. A.

RORDERICK LEAN FARM IMPLEMENTS

"In Use Wherever the Sun Shines."

Variety of kinds suited to the requirements of any country. Correspondence solicited. Catalogues furnished in English, German and Spanish.

RORDERICK LEAN MFG. CO., Mansfield, Ohio, U. S. A.

**Ox Yokes
and Ox Bows**
for Export and Domestic Trade.

For more than forty years we have made several sizes of both Ox Yokes and Ox Bows.

Illustrated Price List sent on request.

The Iowa Farming Tool Co.,
Fort Madison, Iowa,
U. S. A.

CHALLENGE REFRIGERATOR CO.

Our plant, occupying twenty [20] acres of ground, is without question the largest and most complete in every detail of any similar works in the world.

**Over 400,000
Challenge Refrigerators**
sold and in use throughout the
United States of America.

Our catalogue, illustrating and describing the various styles of Refrigerators made by us, mailed postpaid to any part of the world. Prices quoted f. o. b. cars at New York City. Orders received through export commission houses.

Challenge Refrigerator Co.

MANUFACTURERS,

Grand Haven, Mich., U. S. A.

Single-Door Refrigerator.
23 in. long, 15 in. deep, 37 in. high; weight, when packed for export, 90 lbs.; measurement, $9\frac{1}{2}$ cubic feet. Price, f. o. b. New York, \$4.50.

The Handy Fruit and Vegetable Slicer

The most interesting kitchen utensil ever invented. It slices every kind of fruit or vegetable into an infinite variety of unique and fancy designs, making an entirely new, novel and delicious product.

Is invaluable for making delicate salads, garnishings, etc. Makes **Juliennes** ten times as fast as by the ordinary method and is the only utensil that will produce **Lattice Potatoes**. Is extremely simple to operate and sells rapidly wherever shown.

\$16⁵⁰ Upon receipt of **SIXTEEN** and **50-100 DOLLARS** **100** in U. S. Gold or its equivalent, we will deliver boxed, ready for steamer, F. O. B. cars New York, one gross [144] **No. 6 X SLICERS**, for Export only. Weight boxed, 120 lbs.

NOTE.—To facilitate our rapidly increasing export trade we desire to arrange with one responsible business house in each trade center of the world, to handle our **NO. 6 X SLICERS** and other specialties manufactured by us.

HANDY THINGS CO.,

Manufacturers,

LUDINGTON, 40 to 50 Rowe Street, MICHIGAN, U. S. A.

Curiosities of Ocean Marconigrams.

COMMENTING on the failure of Marconi to receive messages through the air from Cape Breton and Poldhu station, Cornwall, on his late trip on the *Lucania* from New York, a wireless operator aboard one of the English steamers recently told an interesting story of the circumstances which led up to the attempt by the wizard to catch messages from those long distances.

"Last summer," said he, "the Minneapolis, of the Atlantic Transport Line, was on her way from New York for London and the operator was attending to business. His instruments began to get agitated and the young man became all attention. It was a service message from the captain of the Cunarder *Carpathia* to the captain of the *Etruria*, and was easily intercepted.

"The operator figured out, as soon as he could get the data, the positions of the *Carpathia* and *Etruria*, and was dumfounded to learn that both Cunarders were on the other side of the ocean at the time he had caught the signals, or 2,000 miles away from the Minneapolis.

"Nobody would believe at first that signals had been read that far, and when it was told to Mr. Marconi his words were: 'That's all d—— nonsense.' He was later convinced that the young man was right and decided to conduct experiments in long-distance receiving for himself."

The Marconi sharp was asked why it was that the *Campania* and the *Lucania* were so much more successful in sending and receiving than the other steamers. Replied he: "The North German Lloyd Line steamers are successful also. I believe that a good deal depends upon the operator. All the Cunarders have first-class operators—men who are not afraid of working overtime and who are always enthusiastic over their profession. Orders are that the instruments shall always be open so as to catch messages from ships in distress if they should need help, but some men consider it an imposition if they are required to stick to their instruments during the entire voyage."

"What is the volume of business now transacted on each trip?" was asked.

"The Cunarders average \$300 in Marconigrams for every trip," was the answer. "The salary of an operator is \$30 for a trip, which leaves, outside of the fee to the Marconi Company, a handsome profit for the ship.

"The first trip of the Kaiser Wilhelm II with the Marconi apparatus returned \$480, which left a profit of about \$400 for the ship. If a steamer can do no more than \$150 or \$200 in wireless telegrams it hardly pays."

"What is the average distance at which messages are transmitted?"

"Under the most favorable circumstances 240 miles is the longest distance between vessels at sea, but the average between the Cunarders is from 130 to 150 miles."

"Why is it that the Marconi Company has not been able to sell its system to the United States Navy?"

"Because the United States Government wants to buy instruments right out, and not simply the use of them. I think myself the Marconi people are making a mistake in not selling their instruments, but they prefer, like the telephone companies, to rent their instruments for five years, after which term they become the property of the user, but they are also worn out at the end of five years, so that it is necessary for the lessee to hire another set."

Great Growth of Steam Yacht Fleets.

SOME of the most interesting and instructive papers ever read before the American Society of Naval Architects and Marine Engineers were the feature of the eleventh general meeting of the society, which was held last month in New York City. One of the papers which aroused discussion was that of Clinton H. Crane, an associate member, on "The Design of Modern Steam Yachts."

"Few realize the great growth in our steam yacht fleet in the last decade," he said. "In the spring of this year the yacht register shows 433 steam yachts of American ownership, with a total gross tonnage of 58,669.23. Of these 253, with a gross tonnage of 28,306.35, have been built since 1890, and 33, with a gross tonnage of 13,765.12, are of English design and build. One hundred and eight of these vessels, gross tonnage 47,277, are more than 120 feet water-line length.

"It is not possible to overstate the boon to our steam yachting of the coming of the first English steam yachts. Before their advent, with hardly an exception, our fleet was composed of low-sided, herring-gutted boats, with good speed, as a rule, but suited only for sound and river use and an occasional dash around the cape after careful waiting for good weather.

"The English boats have, with few exceptions, been little ships, capable of keeping the sea in all weathers; slower in calm weather than our boats, but capable of maintaining their speed in seas that would drive our designs to harbor. The English yacht showed us what could be done in sea-going qualities and comfort, but the American owner was not satisfied with her speed, nor with such minor details as ventilation and plumbing. He did, however, wish to retain her sea-going qualities and the style of her appearance outside and on deck, and he has set us the problem of retaining these desirable features.

"The American yacht has made its gain in speed in three ways—finer lines, lighter machinery, which includes the use of water-tube boilers, and in many cases lighter scantling and equipment. The fast yacht, like the fast warship, is rarely called on to show her maximum speed. Therefore, in spite of the increase of boiler pressure, due to the water-tube boilers, it has not seemed

wise to increase the cylinder ratio. The fact that most of our yachts are coming and going frequently through the East River has placed a limit to desirable size. A boat of 225 feet water-line is unhandy in the swift tide running through Hell Gate."

Wireless Telephones on American Battleships.

NOTWITHSTANDING the secrecy that has attended the matter, the news that experiments in wireless telegraphy between battleships would be begun at the New York Navy Yard was confirmed last week. A. Frederick Collins, formerly of Philadelphia, recently obtained permission from the Navy Department to install his experimental apparatus on the battleships *Kearsarge* and *Alabama*. These two vessels are now moored about 150 yards apart at the navy yard, and Mr. Collins has erected telephone booths on each ship.

Mr. Collins says he has already had considerable success while working his wireless telephone system over a distance of two miles, and he is hopeful of the outcome of his experiments on the battleships. If the apparatus yield satisfactory results it will be installed on all the vessels of the squadron that is about to go to the West Indies for the winter maneuvers.

Mr. Collins is working under the supervision of Lieutenant Hudgins, of the battleship *Kearsarge*, one of the Navy Department experts in wireless telegraphy. Wireless telegraphy has been the subject of several experiments in the Navy Department, and several vessels are equipped with the apparatus, but wireless telephony has not been tried in any navy in the world.

About a year ago Mr. Collins, with a very crude experimental apparatus, tried to see how a wireless telephone system would work on a ferryboat traversing the North River, New York, as reported in *THE AMERICAN EXPORTER* at the time. Since then, he says, he has so far perfected his apparatus that he has heard distinctly a message over a distance of two miles.

In Boston harbor a system of wireless telephony invented by the late Prof. Elisha Gray has been used for some time by vessels of the Boston Fruit Company to locate the fog bells in the harbor in bad weather, particularly at night, when landmarks were invisible, but no attempt has been made to communicate between vessels by use of wireless apparatus.

New Device to Mark Hidden Wrecks at Sea.

IT is entirely probable that for every dollar of treasure which has been hidden or lost there has been expended another dollar in searching for it, many of the searches proving unsuccessful and being simply money thrown away, but still the hunt goes on. This is especially true of wrecked vessels, which were known or supposed to contain treasure, the owners themselves often sending out ships to search for the wreck, in the hope of being able to recover money and freight. If every ship setting out from port were equipped with the apparatus invented by Ruji Sato, of San Francisco, U. S. A., it would be easier to locate it, should it chance to suffer shipwreck and sink to the bottom of the ocean. This indicating apparatus consists of a large buoy, with a reel mounted underneath which contains a quantity of heavy cord, sufficient to reach from the surface to the bottom of the ocean. One end of this cord is made fast to the safe or some other permanent part of the vessel and the other is secured to the buoy, the latter being placed on the upper deck, where it can by no possibility sink with the ship should the latter chance to go down. In the case of an accident the buoy stays on the surface, but is attached to the ship by the line, thus locating the wreck. In addition to the flags to serve as signals, there should be an indicator of some sort on the buoy to give the name of the vessel.

New Russian Steamship Line to America.—The opening of the new Russian steamship line to America was fixed for November 28th. Cargo had been booked from South Russian ports, and a satisfactory complement of emigrants has been secured at Naples. The service is being inaugurated by volunteer fleet vessels. This is the first long-distance Russian steamship line, except that between Russian ports and the Far East. At the time this issue of *THE AMERICAN EXPORTER* goes to press we are without further information concerning what promises to be an important commercial link between Russia and the United States.

Big Cargo for Argentina.—What was probably the largest cargo of merchandise ever sent from the United States to the Argentine Republic was shipped from New York recently in the steamer *Hypatia*, bound to Montevideo. The vessel carried 11,395 cubic tons of cargo, consisting of harvesting machinery, hardware, railway materials, oils, dry goods and sundries. Exports from this country to the Argentine Republic have been extremely heavy recently. This is said to be due to the reports from Argentina that the crops there are the best in many years.

Mosquito Netting Needed in Portugal.—United States Minister Charles P. Bryan, under date of Lisbon, reports that Portugal offers an excellent market for doors and wire screens for windows, which are unknown in that country. The swarming of flies, mosquitoes and other insects nine months of the year would appear to make the demand for such protection universal.

Knock-Down Office and Home Furniture for Export. The "GUNN" K. D. Sectional Bookcases.

Top Section
List, \$3.00

9 1/4" Section
List, \$4.15

11 1/4" Section
List, \$4.50

13 1/4" Section
List, \$5.25

Base Section
List, \$2.65

THREE-SECTION CASE.

With top and base set up. Weighs 135 lbs. gross, 100 lbs. net, and of 6 3/4 cubic feet. This cut represents the entire line of sizes, and will make a case for 10 books or 10,000 books, growing as the books accumulate. Measurements are inside. All sections 10 1/4 inches deep and 32 1/4 inches long. Made of selected quarter-sawn oak and handsome polish finish.

THREE-SECTION CASE, as shown, complete - - - each \$10.76
SIX-SECTION CASE, as shown, complete - - - each \$17.98

IMPORTANT NOTICE.—To secure full benefit of above, even sample orders should not be for less than the steamship minimum for issuing ocean bills of lading. Some steamship companies accept not less than 40 cubic feet, while others not less than 80 cubic feet. Six Three-section Cases occupy 40 cubic feet; Four Six-section Cases occupy 40 cubic feet. NOTE explanation of ocean freight on "Gunn" K. D. Cases: "An ocean rate of 10 shillings per 40 cubic feet equals a cost of eight cents per section, or about four per cent. on the cost boxed f. o. b. New York."

Specify "Gunn" when ordering. Orders received direct or through export houses. When ordering through the latter, to avoid errors, please mail us duplicate of order. Our catalogue, illustrating and describing the various styles of Sectional Bookcases and Filing Cabinets made by us, mailed postpaid.

THE GUNN FURNITURE CO., Grand Rapids, U. S. A.

Western Union and A. B. C. Codes used.

Cable Address: "GUNN," Grand Rapids.

We also make a full line of Roll and Flat Top Office Desks and Typewriter Cabinets.

A FEW REASONS WHY THE "GUNN" K. D. SECTIONAL BOOKCASES ADMIT OF DIRECT IMPORTATION TO THE TRADE.

The assortment is SMALL. All parts are INTERCHANGEABLE, making every possible size bookcase from the same stock. They require but little space in warerooms, as the cases are shipped K. D. (flat) and can be set up as required, with no tools but the hands.

Our method of boxing K. D. (flat) insures arrival of goods in PERFECT CONDITION, as NO POSSIBLE DAMAGE CAN OCCUR TO FINISH AND NONE OF THE PARTS CAN SWELL OR WARP, as in ordinary furniture. Deliveries can be made in thirty days, and by using our special code, twenty days.

ADVANTAGES OF THE LINE.

The field to sell is very large, as the same stock meets the demand from offices and public buildings, as well as for home use—in fact, anywhere an article is desired to be covered from dust and moisture. Each sale made is a guarantee of repeated purchases for additional sections, as books accumulate. The sections can be added, vertically or horizontally, to fit the wall and space. The glass doors, when raised, disappear, sliding on small frictionless roller bearings. The "GUNN" is the only case in which a broken glass can be replaced by simply taking off the door, and without removing the books or taking the case apart. The cases, when set up, present a handsome appearance, with no objectionable features, and are as rigid as an ordinary bookcase.

We GUARANTEE the "GUNN" SECTIONAL BOOKCASES PERFECT IN ALL RESPECTS.

Special Offer for Export Only:

The prices here quoted (U. S. gold or its equivalent) include boxing for steamer, and delivered f. o. b. cars at New York City.

"Gunn" K. D. Sectional Bookcase.

This cut shows our knock-down (flat) construction. It is put together without nails or screws, or dowel-pins; the irons that are fastened to the shelves have upper and lower tongues that fit in the grooves in the bases, center sections and top sections, thereby binding all rigidly together.

Top Section

How Modern Cities Benefit by Electricity.

THE American electric engineer is a versatile and ingenious promoter of improved conditions in the social and industrial world. Prof. H. B. Smith, of the Worcester (Mass.) Polytechnic Institute, in a recent address, directed attention to the value of electricity to the modern city. Two important developments in the field of electrical engineering have had a far-reaching influence upon social manufacturing interests. One of these developments is the long-distance transmission of power, which, on the Pacific Coast and at other points, has wrought a veritable industrial revolution. As Professor Smith remarked:

"In San Francisco a few years ago the cost of electric current for power and light was 15 cents for one horse-power per hour, while to-day the published price is almost exactly one-seventh of this amount, and it is possible to deliver at the factory on the coast, from the melting snows and glaciers of the Rockies, power for the machinery at a smaller cost than at which it is possible to produce that power by steam, even though the fuel were to be delivered at the factory boiler without cost to the power producer.

"The power transmission systems of the Pacific Coast are developing at a rate which is the best possible demonstration of the accuracy of this statement, as the discovery of fuel oil in large quantities on that coast has caused no decrease in plants for, and actual installation of, plants for the electrical transmission of power to points where such fuel can be had for little more than the bare cost of feeding it to the boiler from an adjacent oil well.

"It has been estimated that the quantity of carbonic acid annually exhaled by the population of New York City is about 450,000 tons, and that this amount is less than 3 per cent. of that produced by the fuel combustion of that city, so we may expect that, with the removal of this great source of contamination of the atmosphere, even the air of our greater cities will be practically as pure as that of the country.

"This fact, with many others pointing in the same direction, together with the entire possibility of such power transmission from a purely engineering standpoint, make it no unsafe prediction that in the near future many of the large cities of the world will not see coal except in their mineralogical collections.

"The second and more important development to which particular attention should be given is largely dependent upon this already successful accomplishment of electric power transmission, but has for its field of application the highly important service of railway transportation. The service of our steam railways, contributing so largely to our rapid development as a nation, is meeting a new element which has already wrought great changes in methods of transportation in some localities and is rapidly extending its influences throughout the world. Many of the existing steam railways have failed to recognize the significance of the possibilities of electric railway transportation, and have met its development at every point with vigorous and determined opposition, which in the end can only react upon those maintaining such opposition."

Nature's Battery Worked Telegraph Wires.

ONE of the most remarkable electric freaks occurred early in November, when messages were sent over a 650-mile circuit on the Northern Pacific telegraph lines without batteries, the power being supplied by electricity in the atmosphere, due to the aurora borealis. The superintendent of the company describes the event as follows:

"We found that the electricity from the overcharged atmosphere registered from 23 millimeters positive back to the same figure negative. Pure-green light shot forth at stated intervals toward the earth, and each time it descended it charged the electric wires all over the country to such a degree that all communication was stopped for a time and disturbed for many hours.

"The electrical waves came with the regularity of the pendulum movement. They were of about three minutes' duration each, shifting from negative to positive polarities in almost perfect rhythm. Our instruments showed a maximum intensity of 370 volts.

"When the current was at its maximum positive polarity we could talk to Dickinson very easily by using the regular Morse alphabet. As the pendulum swung back to the negative pole the sounds from the instruments would become fainter and fainter until the pressure came back. Our volt meter was not of high register, 300 volts being its limit. The disturbance commenced at 2 o'clock in the morning and lasted until midnight. It was one of the most remarkable atmospheric disturbances that has come within my knowledge for thirty years."

Increased Use of Electricity in Mills.

ELECTRIC power in place of belting and shafting has been extensively applied in the United States to textile mills and factories generally. The introduction of the steam turbine in place of the ordinary reciprocating engine will hasten and further extend the application of electric motors. The reason is that the steam turbine has so many advantages over the steam engine that it will in time supplant it. At the high speed of turbines, electric generators and motors provide the most economical means of transmitting power and applying it to the operation of machines. The practical elimination of repairs, the freedom from the necessity for adjustment (so necessary to the ordinary engine) and care and attention, the absence of internal lubrication

permitting the condensed steam to be returned to the boilers and avoiding boiler scale by using the same feed water continuously, the lessened floor space, reduction of weight and cost and higher economy are all features in favor of the steam turbine. The requirement of constant speed so desirable for textile mills is obtained by the turbine and electric power to a more thorough degree than with any other system. The first electric generators driven by steam turbines to be used in textile mills will be installed in Southern mills. Three 500-kilowatt turbine units are going in at the Lane Cotton Mills, New Orleans, and two of the same size at the Fulton Bag and Cotton Mills, Atlanta, Ga.—*The Tradesman*.

Electric Mules as Power on Canals.

THE type of motor which has been publicly and privately tested on the New York State canals in the last few days for hauling canalboats possesses several features which distinguish it from any of the dozen or more already tried in this country and Europe. The machine is virtually an electric locomotive, running upon a railway along the tow-path, and hitched to a rope which pulls the boats. It rides upon a single rail, but in order to accommodate motors drawing boats in the opposite direction a second rail is provided, parallel with and near the first. In a certain sense this road is elevated. For a reason about to be mentioned, it is necessary to have a portion of the mechanism reach under the rail, as well as above it. To be more exact, the lower part of the machine extends under the stout I-shaped steel beam on which the rail rests. But the principle and requirements are the same. Space enough to allow freedom of movement must be left between the permanent structure and the ground.

The most novel feature of the design is the method by which "adhesion" is secured. Weight alone might not suffice. Consequently, means have been provided for gripping the railway between the wheels above and the wheels below. Such a pressure can thus be brought to bear that slipping is almost impossible. The same idea has been worked out in another way by electrical engineers at Budapest. When a competitive trial was made on a canal near Berlin a few months ago, a motor supplied by a particular firm was one of twenty that were tested, and it gave more satisfaction than most of its rivals. In this motor a solitary rail was embraced between two wheels that slanted toward it, one on each side. In the American machine the grasp is more direct, and is exerted vertically. No doubt there are other features which differentiate it still further from the Hungarian model.

The motive power used with the latest American machine is electricity. Gasoline or even steam could be used instead, but they have their disadvantages. In the pending experiments a direct current is used, but in case the system is ever installed it is thought that an alternating current would be employed. That is a comparatively unimportant detail. The current is now taken from an overhead wire by the typical trolley pole. For these features the third rail and sliding shoe might, perhaps, be substituted. Still, the form of conductor is not essential. The main novelty is the gripping mechanism whereby adhesion is obtained.

The machine now on trial weighs 12,000 pounds (six tons), and can develop 80 horse-power. Any speed which may be thought desirable can be got out of it. The designer is said to be an engineer of the New York Rapid Transit Commission. To construct a mile of railroad of the type here outlined would probably cost \$18,000. These figures do not include the motors.

Cheap Illumination in an American City.

NO city in the United States, perhaps no city in the universe, has lights as cheap as the city of Assumption, in the State of Illinois. So cheap are the lights that the residents have their barns as well as their residences brilliantly lighted at night with electricity. The business houses are charged 10 cents a light per month. The City Hall and other public buildings that belong to the city are lighted for nothing.

According to reports, the business there is conducted more for fun than for money. There are two electric light plants in Assumption, and competition between the plants has sent the price of electricity down to a mere song.

At the last meeting of the City Council both plants put in a bid for lighting the city buildings. One company made a bid for the work at \$10 a year. The other company, not to be outbid, offered to furnish the lights free, if permitted. The latter offer was accepted.

Novel Safety Idea for New York Subway.—The electro-pneumatic signaling system to be installed on the tracks of the New York City subway passenger railroad will contain a novel feature, in that the system will be operated by alternating current instead of battery current or direct current, as generally used. The necessity for this feature lies in the use of direct current on the rails for the propulsion of the cars, and the danger therefore of this current disturbing the signals. This difficulty is avoided by employing devices which are sensitive to alternating current only.

Like American Dynamos.—J. C. Covert, United States Consul at Lyons, says: "The far greater number of dynamos used in France are made at the Westinghouse and Thompson-Houston Works in Havre and Paris. Men in electrical enterprises in this country say that the great obstacle to receiving their machinery direct from the United States is the high freight rates and the customs duty at French ports."

Steam - ENGINES - Gasoline.

We make a specialty of Steam Engines and Gas and Gasoline Engines and Pumps from a 1 H. P. Combined Engine and Boiler for \$100 and a 2½ H. P. Gasoline Engine for \$125 up to any size in either Vertical, Horizontal, Marine, Hoisting, Pumping, Locomotive and Portable Engines on Wheels.

We also make a full line of Saw Mills and Wood-working Machinery, Turbine Water Wheels, Corn and Wheat Mills, Feed Grinding Mills, Sugar and Plantation Machinery, Cars, Locomotives and Track, Etc.

Send for Catalogues A, D, G, O and W. Correspondence solicited.

Pontiac, Michigan, U. S. A.

MAKERS OF HIGHEST-GRADE

Carriages, Buggies and Wagons.

Peculiarly and especially adapted for foreign markets. Strongly constructed of the best material. Are not affected by climatic changes. Sold at Factory Prices.

OUR LEADERS: Nos. 83 and 429.

No. 83—Top Buggy. Boxed ready for transportation and delivered f. o. b. steamer at New York City. Weighs 650 lbs.; measures, boxed, 95 cu. ft. Price, \$58.50 [£12 1 8].
No. 429—Cut-Under "Bike" Wagon. Boxed ready for transportation and delivered f. o. b. steamer at New York City. Weighs 600 lbs.; measures, boxed, 95 cu. ft. Price, \$95.00 [£19 12 0].

Our 96-page catalogue, profusely illustrating and thoroughly describing the various styles of Carriages, Buggies and Wagons made by us, as well as containing weights, measurements and prices, mailed postpaid. NOTE.—Orders received direct or through export houses. When ordering through the latter, to avoid errors, kindly mail us a duplicate of order.

No. 83—TOP BUGGY.

Made of the best kiln-dried wood.
Trimmings and finish the best obtainable.

No. 429—CUT-UNDER "BIKE" WAGON.

This represents our latest style of "cut-under-body" wagon, allowing a very short turn, making a handsome and up-to-date vehicle.

HORTON MANUFACTURING CO., ESTABLISHED 1871. FORT WAYNE, INDIANA, U. S. A.

Manufacturers of the world-known

Horton Rotary, Western Rotary, "Globe" Improved, The "Western," The "American" and The "Wayne" Round Washing Machines,

Over 600,000 of which are in use in the United States.

Special Inducements offered to parties, desiring restricted territory, ordering in car lots. Prices quoted, boxed ready for steamer, f. o. b. cars New York. Our Illustrated Catalogue mailed postpaid to all parts of the world.

ESTABLISHED 1866.

Architectural Sheet Metal Work, Etc.

Machines to Take the Place of Sculptors.

AMERICANS have taken much interest in reports from abroad regarding the latest development in labor-saving machinery, and an account of the new sculpturing machine which appears in the *American Inventor* is worth reading. There have been previous mentions of this invention, but heretofore no authoritative information has been given on the subject in this country. The writer says: "The general trend of labor-saving inventions to-day seems to be in the direction of improvements of the decorative arts, as well as practical arts. It is true that wallpaper is still designed by hand, but it is duplicated by machinery. The artist in dry-point does only the initial work by hand and sees the finished production come off the printing press. The lithographer's product is half mechanical, and now from London come accounts of a sculpturing machine, which, if not itself an artist, is at least a more perfect copyist than any human laborer could possibly be.

"Near London is in operation a complicated looking, square-set machine, the result of the inventive genius of an Italian sculptor called Bontempi. Sir A. Conan Doyle, the famous novelist and historian, together with W. G. Jones, brought the machine to England and have undertaken to exploit it to English art circles. To fully understand the machine and the benefits which are claimed to result from its use, it is necessary to understand how a statue in marble is at present made from clay. A London journal in commenting upon this feature says that at present when a sculptor has completed his clay model of the statue, which is eventually to be seen in marble, he hands it over to a man known as a 'pointer,' who by the aid of an instrument of that name drills hundreds of tiny holes of various depths in the block of marble which is to be carved into an exact resemblance of the clay model. As many as 15,000 of these small holes have been bored for carving one bust.

"When all the holes have been drilled there comes the man with the chisel and it is his laborious task to chip away the marble, guided by the depths of the holes. When he has finished the sculptor puts in a few touches and the bust or statue is completed. But it is a business which takes, on the average, six weeks to do. The machine at Battersea will finish the work in half a day.

"The machine can work thus quickly, because where the human workman delivers one stroke with his chisel the machine can deliver a hundred. Moreover, working upon the principle of the pantograph it is absolutely accurate and has no fear of making a mistake.

"A long metal pointer delicately balanced and capable of movement in any direction, can be brought into contact with the face of the model. Every movement of this pointer causes an exactly similar movement in two steel drills which play upon the surfaces of the marble blocks. It is obvious, therefore, that inasmuch as no movement of the model is without an exactly similar movement in the blocks and no movement of the pointer can be made without a similar one being made by the drills, it is only necessary to run the pointer delicately over the face of the model to cut out a similar face from the marble blocks. As the pointer cannot go below the surface of the model, the drills are in no danger of making a mistake and taking out too much from the surface of the marble.

"In the same way a statue could be made direct from the living face, although a slight modification of the model support would have to be made. In practice the machine is stopped several times during the operation of duplication in order to introduce finer and finer drills, until at the end of the operation, which takes for an ordinary life-size bust from six to eight hours, the surface is as smooth and delicate as if carefully and laboriously chiseled by the hand of the artist.

"The machine is operated by hydraulic power, but, of course, electricity or steam could easily be substituted. Mr. Jones, one of the gentlemen who is engaged in exploiting the device, says the machine as it at present stands is worth \$2,500, but that less than 50 cents per day is required to run it. It is also pointed out that a chiseler who could do similar work to that of the machine by hand would get from \$20 to \$60 per week and would take a month for a job. It is obvious, therefore, if the machine will do the work to the satisfaction of artists, wherein the profit of its operation will lie."

Fixing Money Value of Radium.

WITH reference to the value of radium, radium chloride of the activity of 240 sells for about \$30 an ounce, says *The Review of Reviews*.

The radium salts used in the recent experiments at the American Museum of Natural History, 127 milligrams—equal to about one-eighth of a gram, or 1-249 of an ounce—represented a value of \$274, or at rate of \$64,800 per ounce troy. This radium was of the activity of 300,000.

The museum ordered, at the request of Edward D. Adams, of New York City, as a gift to carry on the investigations, radium of an activity of 1,800,000, valued at \$660 for 100 milligrams, or at the rate of \$198,000 per ounce. The small sample used represents the concentration of more than one ton of pitchblende; the 1,800,000 sample, probably, the concentration of four or five tons, and yet the entire quantity could be put in the end of a thimble and not occupy one-fourth of the space remaining between that and the finger. Radium compounds with an activity of 40 can be bought for \$20 an ounce. It is only when it has been fractionated and increased in its activity that it becomes very costly—like steel, itself worth only a trifle per pound, but worth many times the value of gold when manufactured into watch-springs.

The Farmer and the Automobile.

THE automobile will not milk the cow nor tend the baby, but it will churn the butter and grind the cornmeal and do pretty nearly every other kind of work on the farm. After the farmer sees the exhibit of farm implements made by the manufacturers of South Bend, Ind., U. S. A., at the World's Fair, to which the South Bend *Tribune* calls attention, and in which the automobile plays a stellar rôle, much of the antipathy formerly felt by the ruralist for the horseless carriage will be removed. Of course, the South Bend manufacturers will not neglect the auto as a pleasure vehicle, but it is the uses to which the machine may be put on the farm that will prove most novel and interesting.

An automobile with a plow attachment will be in operation, showing how much faster the soil can be turned with the new power than when the plow is drawn by horses. The automobile harrow will make Dobbin turn green with envy, so much more smoothly does it glide over the field. Another exhibit will show the automobile used as a farm wagon. The practicability of mowing hay and wheat with agricultural automobiles will be demonstrated. The traction engine used by threshers has paved the way for the automobile in this field, and it will not appear as so great a novelty.

The versatility of the automobile will be demonstrated when it is seen, as it actually will be, in the palace of agriculture, grinding grain. The same machine that conveys the farmer and his family to church on Sunday may be placed in the barn on week days and the wheels, as they turn upon certain riggings in the floor, will grind the farmer's grist. This is not all of the uses the automobile may be put to on the farm. There are many others, and all will be shown at the World's Fair. South Bend is a great manufacturing center, and she will make an exhibit that will call attention to her importance.

United States Tests Automatic Rural Letter-Carrier.

AN American genius living at Corning, Ia., Nelson S. Howell by name, has invented an automatic rural free-delivery carrier that he wants adopted by the United States Post-Office Department. The apparatus is very simple and will be considered seriously by a commission from the Department, which will visit a locality where a rural free-delivery route, thirty miles long, fitted with the automatic carrier and making deliveries every hour, is in operation.

The idea of the invention is to carry the mail with a cable attached to telephone poles and similar available supports, and which will be automatically regulated by clockwork so as to drop the mail off along the line to the person to which it belongs. Each person will have a number, and the mail is so placed in the carrier that when it comes to each station the mail allotted to that place will drop in the letter-box, the carrier continuing its journey to the next station.

The short line already established has given great satisfaction, not only because of the accuracy of the apparatus, but because mail deliveries can be made as frequently as desired. The cable of a thirty-mile route can be moved by one and a half horse-power gas or hot air engine at a speed that can be regulated at will.

World's Demand for Tool-Making Machines.

THE *Deutsche Industrie Zeitung*, in a recent issue, calls attention to a congress or convention of Germany's tool-machinery makers. Reports made by those present went to show an increase of business in the Empire, but the orders were not large enough nor the prices satisfactory. The orders from the Government were not nearly as large as desired. Complaint was made against the custom of the large iron mills of contracting for machinery only on condition that part payment be made in the iron or steel products of the mills. Another evil complained of is the custom of the German iron or steel mills of making their own conditions when contracting, instead of following, as formerly, well-established customs. In the matter of contracts in which it is provided that the toolmakers take steel or iron from the mill great abuses have crept in. Reports made to the convention regarding Germany's foreign trade show a decline. In France everything was quiet. Italy offered little encouragement. Spain promises great things by and by, particularly for the marine. The United States, it was said, must be given up as hopeless because of its own development of machine making.

Parcels Post Treaty with Hong Kong.—United States Postmaster-General Payne and Arthur Raikes, Chargé d'Affaires of the British Embassy, at Washington last month signed the parcels-post treaty between the United States and Hong Kong, which has been in preparation for some time. The treaty is practically the same as the parcels-post convention now existing between the United States and Germany, except that the weight limit of packages is four pounds six ounces in the new treaty, instead of eleven pounds, as in the old convention. The treaty was later signed by the President and will go into effect on January 1, 1904.

Changes in Manufacturing Company.—Irving H. Reynolds will shortly retire from the Allis-Chalmers Company, and the duties of chief engineer will be assumed by the engineers in charge of the various departments. These engineers will avail themselves of the advice of Edwin Reynolds, consulting engineer of the company.

De Laval Cream Separators.

Immediate and absolutely complete separation of cream from milk by machinery.

400,000 Machines in Use throughout the Dairy World.

A saving of 10 to 25 per cent. in any climate, and 25 to 100 per cent. in warm countries.

Increased Quantity and Improved Quality of Butter and Cream.

Machines Simple, Durable and Easily Operated.

Satisfaction Guaranteed.

Prices, \$50 to \$225.

Hand or Power. Any Capacity.

Address for Catalogue and Any Desired Particulars,

"IN ITS SIMPLICITY LIES ITS EFFECTIVENESS."

Portable Galvanized Iron Ovens.

Portable Oven No. 116—Open.

We make the kind the United States Government buys and which is being adopted by Foreign Governments as well as by those interested in the economical baking of the products of flour, meat and vegetables.

Either Coal, Wood, Natural or Artificial Gas can be utilized as Fuel. Used by Bakers, Hotels, Steamships, Restaurants, Confectioners, Colleges, Asylums, Private Residences and in Japanning, Enameling and Core Baking.

FOR FOREIGN MARKETS ONLY:

Upon receipt of price (as below) in U. S. Gold or its equivalent we will deliver F. O. B. Cars New York, boxed ready for steamer as follows:

PORTABLE OVEN No. 114—Has three shelves (28x20 inches each shelf) holding at one baking Thirty Large Loaves of Bread. Weight, boxed, 300 pounds. Price.....\$ 37.50

PORTABLE OVEN No. 116—Has five shelves (33x20 inches each shelf) holding at one baking Sixty Large Loaves of Bread. Weight, boxed, 500 pounds. Price.....\$ 62.50

PORTABLE OVEN No. 119—Has ten shelves (38x20 inches each shelf) holding at one baking One Hundred and Sixty Large Loaves of Bread. Weight, boxed, 1000 pounds. Price, \$125.00

Orders received direct or through export houses. When ordering through export houses, to avoid errors, please mail us a duplicate of order.

Cold Chisels.

We have been making Tools for over 32 years and are selling our Cold Chisels to many of the largest American jobbers.

To introduce our product to the Foreign Trade we will on receipt of \$50.00 U. S. gold, or its equivalent, pack for export and deliver in New York the following Assortment of our Cold Chisels:

15 dozen Chisels made of	3/8	1/2	3/4	1	1 1/4	1 1/2	1 3/4	2	2 1/4	2 1/2	2 3/4	3	3 1/4	3 1/2	3 3/4	4	4 1/4	4 1/2	4 3/4	5	5 1/4	5 1/2	5 3/4	6	6 1/4	6 1/2	6 3/4	7	7 1/4	7 1/2	7 3/4	8	8 1/4	8 1/2	8 3/4	9	9 1/4	9 1/2	9 3/4	10	10 1/4	10 1/2	10 3/4	11	11 1/4	11 1/2	11 3/4	12	12 1/4	12 1/2	12 3/4	13	13 1/4	13 1/2	13 3/4	14	14 1/4	14 1/2	14 3/4	15	15 1/4	15 1/2	15 3/4	16	16 1/4	16 1/2	16 3/4	17	17 1/4	17 1/2	17 3/4	18	18 1/4	18 1/2	18 3/4	19	19 1/4	19 1/2	19 3/4	20	20 1/4	20 1/2	20 3/4	21	21 1/4	21 1/2	21 3/4	22	22 1/4	22 1/2	22 3/4	23	23 1/4	23 1/2	23 3/4	24	24 1/4	24 1/2	24 3/4	25	25 1/4	25 1/2	25 3/4	26	26 1/4	26 1/2	26 3/4	27	27 1/4	27 1/2	27 3/4	28	28 1/4	28 1/2	28 3/4	29	29 1/4	29 1/2	29 3/4	30	30 1/4	30 1/2	30 3/4	31	31 1/4	31 1/2	31 3/4	32	32 1/4	32 1/2	32 3/4	33	33 1/4	33 1/2	33 3/4	34	34 1/4	34 1/2	34 3/4	35	35 1/4	35 1/2	35 3/4	36	36 1/4	36 1/2	36 3/4	37	37 1/4	37 1/2	37 3/4	38	38 1/4	38 1/2	38 3/4	39	39 1/4	39 1/2	39 3/4	40	40 1/4	40 1/2	40 3/4	41	41 1/4	41 1/2	41 3/4	42	42 1/4	42 1/2	42 3/4	43	43 1/4	43 1/2	43 3/4	44	44 1/4	44 1/2	44 3/4	45	45 1/4	45 1/2	45 3/4	46	46 1/4	46 1/2	46 3/4	47	47 1/4	47 1/2	47 3/4	48	48 1/4	48 1/2	48 3/4	49	49 1/4	49 1/2	49 3/4	50	50 1/4	50 1/2	50 3/4	51	51 1/4	51 1/2	51 3/4	52	52 1/4	52 1/2	52 3/4	53	53 1/4	53 1/2	53 3/4	54	54 1/4	54 1/2	54 3/4	55	55 1/4	55 1/2	55 3/4	56	56 1/4	56 1/2	56 3/4	57	57 1/4	57 1/2	57 3/4	58	58 1/4	58 1/2	58 3/4	59	59 1/4	59 1/2	59 3/4	60	60 1/4	60 1/2	60 3/4	61	61 1/4	61 1/2	61 3/4	62	62 1/4	62 1/2	62 3/4	63	63 1/4	63 1/2	63 3/4	64	64 1/4	64 1/2	64 3/4	65	65 1/4	65 1/2	65 3/4	66	66 1/4	66 1/2	66 3/4	67	67 1/4	67 1/2	67 3/4	68	68 1/4	68 1/2	68 3/4	69	69 1/4	69 1/2	69 3/4	70	70 1/4	70 1/2	70 3/4	71	71 1/4	71 1/2	71 3/4	72	72 1/4	72 1/2	72 3/4	73	73 1/4	73 1/2	73 3/4	74	74 1/4	74 1/2	74 3/4	75	75 1/4	75 1/2	75 3/4	76	76 1/4	76 1/2	76 3/4	77	77 1/4	77 1/2	77 3/4	78	78 1/4	78 1/2	78 3/4	79	79 1/4	79 1/2	79 3/4	80	80 1/4	80 1/2	80 3/4	81	81 1/4	81 1/2	81 3/4	82	82 1/4	82 1/2	82 3/4	83	83 1/4	83 1/2	83 3/4	84	84 1/4	84 1/2	84 3/4	85	85 1/4	85 1/2	85 3/4	86	86 1/4	86 1/2	86 3/4	87	87 1/4	87 1/2	87 3/4	88	88 1/4	88 1/2	88 3/4	89	89 1/4	89 1/2	89 3/4	90	90 1/4	90 1/2	90 3/4	91	91 1/4	91 1/2	91 3/4	92	92 1/4	92 1/2	92 3/4	93	93 1/4	93 1/2	93 3/4	94	94 1/4	94 1/2	94 3/4	95	95 1/4	95 1/2	95 3/4	96	96 1/4	96 1/2	96 3/4	97	97 1/4	97 1/2	97 3/4	98	98 1/4	98 1/2	98 3/4	99	99 1/4	99 1/2	99 3/4	100	100 1/4	100 1/2	100 3/4	101	101 1/4	101 1/2	101 3/4	102	102 1/4	102 1/2	102 3/4	103	103 1/4	103 1/2	103 3/4	104	104 1/4	104 1/2	104 3/4	105	105 1/4	105 1/2	105 3/4	106	106 1/4	106 1/2	106 3/4	107	107 1/4	107 1/2	107 3/4	108	108 1/4	108 1/2	108 3/4	109	109 1/4	109 1/2	109 3/4	110	110 1/4	110 1/2	110 3/4	111	111 1/4	111 1/2	111 3/4	112	112 1/4	112 1/2	112 3/4	113	113 1/4	113 1/2	113 3/4	114	114 1/4	114 1/2	114 3/4	115	115 1/4	115 1/2	115 3/4	116	116 1/4	116 1/2	116 3/4	117	117 1/4	117 1/2	117 3/4	118	118 1/4	118 1/2	118 3/4	119	119 1/4	119 1/2	119 3/4	120	120 1/4	120 1/2	120 3/4	121	121 1/4	121 1/2	121 3/4	122	122 1/4	122 1/2	122 3/4	123	123 1/4	123 1/2	123 3/4	124	124 1/4	124 1/2	124 3/4	125	125 1/4	125 1/2	125 3/4	126	126 1/4	126 1/2	126 3/4	127	127 1/4	127 1/2	127 3/4	128	128 1/4	128 1/2	128 3/4	129	129 1/4	129 1/2	129 3/4	130	130 1/4	130 1/2	130 3/4	131	131 1/4	131 1/2	131 3/4	132	132 1/4	132 1/2	132 3/4	133	133 1/4	133 1/2	133 3/4	134	134 1/4	134 1/2	134 3/4	135	135 1/4	135 1/2	135 3/4	136	136 1/4	136 1/2	136 3/4	137	137 1/4	137 1/2	137 3/4	138	138 1/4	138 1/2	138 3/4	139	139 1/4	139 1/2	139 3/4	140	140 1/4	140 1/2	140 3/4	141	141 1/4	141 1/2	141 3/4	142	142 1/4	142 1/2	142 3/4	143	143 1/4	143 1/2	143 3/4	144	144 1/4	144 1/2	144 3/4	145	145 1/4	145 1/2	145 3/4	146	146 1/4	146 1/2	146 3/4	147	147 1/4	147 1/2	147 3/4	148	148 1/4	148 1/2	148 3/4	149	149 1/4	149 1/2	149 3/4	150	150 1/4	150 1/2	150 3/4	151	151 1/4	151 1/2	151 3/4	152	152 1/4	152 1/2	152 3/4	153	153 1/4	153 1/2	153 3/4	154	154 1/4	154 1/2	154 3/4	155	155 1/4	155 1/2	155 3/4	156	156 1/4	156 1/2	156 3/4	157	157 1/4	157 1/2	157 3/4	158	158 1/4	158 1/2	158 3/4	159	159 1/4	159 1/2	159 3/4	160	160 1/4	160 1/2	160 3/4	161	161 1/4	161 1/2	161 3/4	162	162 1/4	162 1/2	162 3/4	163	163 1/4	163 1/2	163 3/4	164	164 1/4	164 1/2	164 3/4	165	165 1/4	165 1/2	165 3/4	166	166 1/4	166 1/2	166 3/4	167	167 1/4	167 1/2	167 3/4	168	168 1/4	168 1/2	168 3/4	169	169 1/4	169 1/2	169 3/4	170	170 1/4	170 1/2	170 3/4	171	171 1/4	171 1/2	171 3/4	172	172 1/4	172 1/2	172 3/4	173	173 1/4	173 1/2	173 3/4	174	174 1/4	174 1/2	174 3/4	175	175 1/4	175 1/2	175 3/4	176	176 1/4	176 1/2	176 3/4	177	177 1/4	177 1/2	177 3/4	178	178 1/4

in the World.**

BOTTLED BEERS FOR EXPORT
OUR SPECIALTY.

The Perfect Coffee Classifier.

MONITOR COFFEE SEPARATOR AND GRADER.

This machine removes all foul material and fragments, makes clean separations and grades perfectly in five sizes: Large, medium and small flats, large and small peaberry.

Made in five sizes, and capacities from 6 to 30 bags per hour.

Monitor Rice Separators are used more extensively in the rice industry than any other make of machine.

Monitor Grain, Cereal and Seed Cleaners are unequalled for quantity and superiority of work and low operating expense.

Send to-day for our Illustrated Catalogue of the entire Monitor line, with export prices F. O. B. steamship, New York City.

HUNTLEY MFG. CO., Silver Creek, N. Y., U. S. A.

The Standard Fans.

Style B Fan with Regulating Switch.

Our Fans are used in all parts of the world. Our experience with foreign requirements enables us to meet all conditions, especially in respect to special insulation. Other strong points are, artistic design, high finish, economy in operation and blade-carrying power.

Recommendations of our customers are our best guarantees.

**CEILING, DESK and BRACKET types, for
all direct-current circuits.**

THE STAR BRASS WORKS,

The Largest Exclusive Trolley Wheel and Harp Makers in the World,

KALAMAZOO, - - - MICHIGAN, U. S. A.

KALAMAZOO TROLLEY WHEEL.

Thousands of Protectographs

Are now in daily use by the leading financial, industrial and mercantile institutions of America, and are exclusively employed by the United States Government.

The machine is a marvel of simplicity, being but six inches square and weighing only ten pounds, boxed ready for shipment. One movement of the lever indents the limiting line upon any preferred part of the check (see reduced facsimile of check) and by its system of compound levers forces an especially prepared indelible ink into the fiber of the paper, making it a part of the document itself and rendering its removal impossible.

The Protectograph is made to conform to the monetary standard of all countries and to print in any language. The price is \$30, delivered New York City.

G. W. TODD & CO., Mfrs., 40 Trust Bldg., Rochester, N. Y., U. S. A.

EXCLUSIVE AGENCIES GIVEN.

Orders executed either direct or through export commission houses.

Two Good Ones.

THE SAMSON SCREW DRIVER, No. 125, is a screw driver constructed to stand not only the use but the abuse to which such tools are subjected. They have inserted bits, as shown in cut, and are very easy to replace after being worn out or broken.

Send for our Catalogue E, describing the line of tools which we make. Orders filled through commission merchants. Correspondence solicited.

SAWYER TOOL MFG. CO., Fitchburg, Mass., U. S. A.

No. 38 COMBINATION Square is the best tool of this description made. They are fitted with hardened blades which will outwear a dozen soft ones; they are neat in design, nicely finished and guaranteed accurate.

WILLIAM D. WARNER, PROVIDENCE, R. I., U. S. A.

SOLE MANUFACTURER AND EXPORTER OF

Herculene Cold Water Paint.

Used both for outside and inside work. Sanitary, fireproof and durable. A substitute for paint, whitewash and kalsomine. Packed in dry powder form. Five pounds make a gallon of paint. Used universally in factories, warehouses, public buildings, etc. Orders filled through commission houses. Correspondence solicited. Catalogue D on application.

"THE" Mouse and Rat Trap. WHY?

Because, as compared with all other traps, it is **SUPERIOR**. All Metal Japanned. It Catches. Easily Cleaned. Easily Set. The Best Trap Made. The **BAIT BOX** is the best manner of baiting a trap that has ever been invented, and the bait cannot be eaten by a mouse without springing the trap. This is not a cheap trap, that is a mere excuse; it is substantial and durable, and it catches. It pays a good profit to the merchant and gives satisfaction to the customer. They are made to catch rats and mice, and they catch them.

J. K. OSBORN MFG. CO., Harrison, N. J., U. S. A.

MARINE GASOLINE ENGINES

1 3/4 H. P. to 500 H. P.

Irving's Wizard Top
IS A Scientific Wonder.

A Top within a Top. Made of STEEL, nickel-plated. Is a veritable **Rotary Engine**, gyrating in contrary directions while running at full speed. Its average spin is 8 minutes. Performs over 40 tricks. A child can spin it in 3 seconds. It maintains its equilibrium at any angle. Walks a tight or slack wire. **Has no equal in the novelty world.** Sells at sight. Over 500,000 sold in 17 months in the United States. The accompanying cuts illustrate only a few pedestal tricks.

See Special Export Proposition.

\$18.00. Upon receipt of Eighteen Dollars in U. S. gold, or its equivalent, we will box ready for steamer, f. o. b. cars New York, one (1) gross of the Tops, with Trick Outfits complete. Size of case, 24x12x11 in.; gross weight, 54 lbs.

Prompt Deliveries and Entire Satisfaction Guaranteed. ORDER NOW!

IN BUYING THE WONDERFUL

(For Water Tube Boilers)

The same machine can also be used for return tubular boilers, which
is provided with a hammer instead of cutter as it appears on this cut.

DIAMOND BOILER TUBE CLEANER.

The only known and successful device for removing scale and soot from return
tubular or water tube boilers. Same machine can be used for both styles of boilers by
changing the hammer. From 20 to 60 per cent. in fuel saved;
prolongs the life of boilers, and is the means of avoiding
possible accidents. Our Diamond Cleaner is in use in every
part of the world, to whom we can refer you. Every Diamond
Machine bears this trademark and is also stamped with our
name.

"SUVLIGHT," THE LIGHT OF THE AGE.
Patent No. 788160—150 candlepower—saves 80 per cent.
of gas and gives a beautiful electric effect.

Never Blackens Mantles.
Incandescent Burners, as generally constructed, give
much annoyance and trouble always to get the exact mix-
ture of gas and air to make the most effective combustion,
but with "Suvlight," by the simple movement of the thumb,
the exact proportion of gas and air and the highest possible
illumination are instantly obtained. Adapted for all kinds of
lamps, mantles and any variation of gas pressure. It is the
long-felt want in private and business houses. Write for
lowest export prices.

**"SUVIO" GAS
HEATERS**

Introduced into the Whole World. Good for All Seasons,
"Suvio" has stood the test of time. Name "Suvio" and
Patent Nos. 571916, 27876, 573205 stamped on top of each
heater. If you handle similar heaters be sure they are not
infringements, and thus render yourself liable for damages.
"Suvio" is the real thing—better and cheaper.

"NEW JERSEY" COPPER PAINT

A PAINT THAT PROTECTS.

The board here represented was placed in the water at Port Royal, S. C., by me, and left in the water five months. The painted end was as good as when it was placed in the water.
MILLS EDWARD, Master Schooner "Florence Shay."

LEADS THEM ALL,

So Our Testimonials Say.

We guarantee this Copper Paint to be the easiest to apply and, owing to its being so finely ground, it is the smoothest paint in the market.

Highest Medals from National Export Exposition and American Institute, New York City.

New Jersey Yacht Red Copper

For Yachts. Brightest Color Made.

New Jersey Seam Paint,

A Perfect Substitute for Pitch.

NEW JERSEY PAINT WORKS,

HARRY LOUDERBOUGH, Proprietor,

JERSEY CITY, N. J.

U. S. A.

Remarkable Fact.

This cut is a copy of a photograph of a board having one end painted with New Jersey Copper Paint, manufactured by Harry Louderbough, proprietor of New Jersey Paint Works, Jersey City, N. J., U. S. A., and placed in the water at Port Royal, S. C., for five months. Upon the unpainted end you can note the ravages of the salt-water worm so destructive to wood, and also the large number of barnacles that have fastened upon it. Observe the painted end, where New Jersey Copper Paint was applied—its splendid condition.

Shoe - Upper Leathers OF ALL KINDS.

Embossed Metal Ceilings and Side Walls

are the modern fireproof interior. Highly ornamental. Will not crack, peel or fall off. More durable than plaster or plaster of Paris. "Canton" Metal Ceilings are the best metal ceilings because the construction is right. Previous experience unnecessary to erect them. Plans and working drawings showing application mailed with every order. Made in classified designs suitable for lodge halls, churches, store rooms, palaces or cottages.

THE CANTON STEEL ROOFING CO.,
Factory and Office: CANTON, OHIO, U. S. A.

PERFECT PROTECTION. PERFECT RELIABILITY. PERFECT SIMPLICITY.

THE WAGGONER WATCHMAN CLOCK

Reduces the Rates of Insurance.

A watchman clock, or recorder, is a device to be placed in the office, connected by wires to various stations about the premises, which the watchman is required to visit at regular intervals. The watchman records his visit at each station, which record is transmitted to the clock and recorded on a paper dial, showing the time and station registered. The watchman **does not have access** to the clock containing paper dial upon which his visits are registered.

There is not a manufacturing concern of any kind or description in the entire world but that is in need and a possible purchaser of a **Waggoner Watchman Clock.**

As many stations as desired can be connected to one clock. To introduce abroad we are shipping (boxed ready for steamer, f. o. b. New York,) **One Waggoner Watchman Clock**, with apparatus for four (4) stations, upon receipt of **\$50.00** in U. S. money or its equivalent. The charge for each additional station is **\$5.00**.

With the view of increasing our foreign connections, we desire to correspond with leading business firms of undoubted facilities and financial standing in each trade center of the world.

Our Illustrated Catalogue, describing in detail the Waggoner Watchman Clock, mailed postpaid to all parts of the world.

The Follett Numbering Machine. Price, \$5.
 Numbers from One to One Million.
 Style of Figures. The best and lowest priced numbering machine in the world.
 123456
 The wheels and figures are constructed of specially prepared steel in such combination with other hard metals as to give the greatest durability and clear, clean-cut imprints.
 No intricate directions required to set figures at any given number. All that is necessary is to turn the wheels around to the number desired. It will then print consecutively right on up to one million, duplicating, triplicating or repeating any number as many times as desired. Dozen rate, 30 per cent. off.
Cushman & Denison Mfg. Co., Mfrs.
 241 W. 23d Street, New York, U. S. A.

OUT-HATCHES ITS COMPETITORS!

Why does the Reliable Incubator give such remarkable results—hatching 85, 90, 95 per cent. of the fertile eggs? Because our heating, regulating and ventilating systems give pure, vitalizing oxygen to germ and growing chicks. Other reasons why the Reliable is a profit-bringer are its durability, and economy of time and material. It has double top and bottom, made of best kiln-dried lumber, so treated as not to absorb moisture.

Reliable Incubators

have trays so constructed that it's easy to reach either eggs or chicks. Remember, too, that the Reliable out-hatches its competitors so often because the heat in corner or center is always the same temperature—a mellow, even heat in every cubic inch of the egg chamber. Our new catalogue is free. It tells a lively story giving warnings, and simple, yet full instructions on hatching and raising poultry successfully. Just send 10 cents to pay postage.

O-HI-O STEAM COOKER & OIL STOVE CO.,

656-660 Jefferson St., Toledo, Ohio, U. S. A.

WE WANT FOREIGN AGENTS, and to get them quickly we are making the following liberal proposition for this month:

No. 4, square, copper tank, retails at \$6.00 each, 13-gallon food capacity; 6 cookers in a box. Measurements and weights of boxes holding six: Gross weight, 120 lbs.; Net weight, 90 lbs.; Cubic ft. in six, 11½. Price, f.o.b. New York, \$34.50 doz.

No. 3, round Cooker, retails at \$6.00, 10-gallon capacity, 12 cookers in a box, nested solid. Measurements and weights, 12 in a box: Gross weight, 150 lbs.; Net weight, 120 lbs.; Cubic ft. in 12, 11½. Price, f.o.b. New York, \$32.00 doz.

These are our best sellers, but we make twenty different styles of cookers, boxed ready for steamer. Order direct or through export house; in latter case mail duplicate order to us to avoid errors. We manufacture a full line of Kitchen Specialties and Blue-flame Wickless Oil Stoves; all styles and sizes; prices from \$3.00 to \$22.00; 30 per cent. discount. Prices in U. S. currency or its equivalent. The Cooker saves 50 per cent. in fuel, time, labor and provisions. Saves services of a cook, or makes a good cook out of a poor one. Insures you deliciously cooked, easily digested, never spoiled, steaming hot meals, all cooked over one burner. Handsomely illustrated catalogue free.

No. 4 Cooker, Square.

TO ADVERTISERS.

THE AMERICAN EXPORTER is the only *independent* and *impartial export paper published*. It is *independent* because its publishers are not engaged in any other branch of the export business. They are neither export commission merchants nor manufacturers' selling agents, and hence they are under no more obligations to one advertiser than to another.

It is *impartial* because it treats all its patrons alike. It cannot, for this reason, and it does not, publish write-ups or puffs of any specific make of goods, no matter whether advertised in it or not. It charges the same price for the same services to all alike.

We desire it distinctly understood by those who contemplate advertising in THE AMERICAN EXPORTER that space for advertising purposes is sold only upon the merits of the publication for that purpose. For this reason no advertising solicitor or agency has any right or authority to agree to give reading notices or to perform any special service whatever to obtain orders for advertising.

We make it a practice not to discuss the merits or demerits of other export trade papers. Comments on their value may be made with more propriety by those advertisers who have had experience in the use of such publications.

Does Not Scale Off.

Hook's "Rapid" Painting Machine

Does the work of fifteen men with brushes, and does it better. Thousands in use.

Hook's No. 10 "Rapid" Painting Machine consists of a special **brass liquid and air pump attached to a heavy ALUMINIZED iron tank**, and equipped with ten feet of hose, extension pipe (for reaching overhead work without the use of scaffolds or ladders) and special painting nozzle.

It will save its cost in painting 5000 sq. ft. of surface.
Will spread any liquid of a sprayable nature.

SPECIAL OFFERS FOR EXPORT ONLY:

Upon receipt of **TEN DOLLARS** we will box and deliver f. o. b. cars at New York City **ONE No. 10 "RAPID" PAINTING MACHINE**, complete; gross weight, 40 lbs.; box, 12½x12½x36 inches; or,

Upon receipt of **SIXTY DOLLARS** we will box and deliver f. o. b. cars at London, England, **SIX OF THE No. 10 "RAPID" PAINTING MACHINES**, complete.

Equally low prices to other foreign ports. Remittances to be in U. S. gold or its equivalent.

We refer to 30,000 satisfied users of our machines.

The "Stay-There" Ready-Mixed Cold Water Paint

is composed of minerals ground in a liquid chemical, to be thinned with water. Packed in tight, iron-hooped barrels. **IT IS AS DURABLE AS OIL PAINT; will not chalk or peel off; is fireproof, waterproof, washable and sanitary.**

Upon receipt of **SIX DOLLARS** we will deliver f. o. b. cars at New York City **ONE HUNDRED GALLONS of WHITE "STAY-THERE" PASTE PAINT**. Gross weight, 400 lbs.; barrel, 28x28x20½ inches.

Our 1904 Catalogue, illustrating and describing the largest line of Painting Machines for every purpose, and the "Stay-There" Paint, will be mailed free to any part of the world. We will open accounts with responsible importers furnishing American references. Orders accepted through New York commission houses.

Improved Rice Huller and Polisher.

OUR RICE HULLER

Is the only machine that will take rough rice and in one operation make it merchantable. For simplicity, durability and economy has no equal. They are used on plantations, and also in the largest mills. Both the Coffee and Rice Hullers are made of iron and steel, and can be knocked down and packed for mule transportation if desired.

OUR COFFEE HULLER

Will hull pulped or cherry coffee without breaking or leaving unhulled a single grain. The products will come out clean, polished and free from hulls, ready for bagging, all in one operation. It is the **only** machine that will grind the hulls fine, so that they may be sucked by the blower through the screen underneath the machine, leaving every grain of coffee inside of the machine, no matter how small it may be.

DIETZ
Nos. 30 and 60
TUBULAR
SEARCH
LIGHTS.

These lamps are made for outdoor or indoor use. They give a powerful and brilliant light, and are not affected by the wind.

They are suitable for use in mills workshops, warehouses, stables and summer resorts, or in any other place where a good light is required which will not be affected by strong breezes.

Where it is desired to light up a long row of animals or a long, narrow room of any kind, these lamps are especially desirable.

No. 30 is fitted with our patent bull's-eye lens on perforated plate, adding to the appearance of the light.

No. 30 has a blizzard globe, 1-inch wick and a bright tin reflector 12 inches in diameter. Price, \$30.00 dozen.

No. 60 has a No. 2 globe, 1 1/4-inch wick and a bright tin reflector 16 inches in diameter. Price, \$72.00 dozen.

We are pleased to send complete catalogues (Spanish or English) and price list to those interested.

Traveling Cranes.

Patch Electric Floor Surfer and Polisher.

The Patch Electric Floor Surfer and Polisher is a device to dispense with the labor usually employed in dragging heavy weights over tile and mosaic floors to produce an even surface. It is also serviceable for polishing large granite and marble surfaces, and sanding wooden floors. The motor is 2-horsepower, and will be furnished any voltage required. The voltage required should be particularly mentioned when ordering. The surface wheel is 20 inches in diameter. The sand box and water tank are conveniently located, supplying either sand or water as desired. The truck wheels have a heavy rubber tire, thus preventing marring the surface. The machine is shipped ready for immediate use. Gross weight, crated, 900 pounds. Net weight, 800 pounds.

"The White Lily Washers, Wash Lily White."

Such is the verdict of thousands of users throughout the "States" of the

WHITE LILY WASHER.
WASHES LILY WHITE.

White Lily Washer.

The White Lily (Rotary) Washer is made from Louisiana and Mississippi Red Cypress, which is less susceptible to expansion and contraction caused by hot or cold water than any other timber known. Our hinges are put on with bolts instead of screws, and every part is reinforced wherever necessary, thus making the

Most Durable Washing Machine Made.

By the use of a HIGH-SPEED ROTARY WASHING MACHINE you can create a soap-suds or foam without having to turn the fly-wheel so fast that the SPEED, rather than the work, tires the operator.

The speed of the White Lily Washer is $2\frac{3}{4}$ turns of the fly-wheel to one turn and return of the dasher. The White Lily Washer is the Highest-Speed Rotary Washing Machine made. Will create more soap-suds with less exertion, and will wash clothes cleaner than any other known washing machine.

Special Offer to Introduce Abroad:

Upon receipt of **Thirty-three dollars** (\$33.00) in U. S. gold or its equivalent we will box, ready for transportation abroad and delivered F. O. B. cars at New York City, **Six (6) White Lily Washing Machines.**

NEW YEAR IN A NEW ERA.

STATISTICS are dry, figures are tiresome and facts are apt at times to be boresome, so that THE AMERICAN EXPORTER, in wishing its readers a Happy New Year, will abstain from going into extended detail regarding the year just ended and what may be expected in the year to come. In 1903 the exporters of the United States made considerable gains; in some industries the increases were remarkable, and, taken altogether, the year was very satisfactory to merchants engaged in foreign trade. The outlook for 1904 is brighter than it has been on any January 1st since this publication was established—over a quarter of a century ago. There is no hint of a cloud on the horizon, so far as the export trade of the United States is concerned. There are many stars in the skies that may lead our enterprising merchants to new fields, and there is a general tendency toward expansion in trade in the international markets that cannot fail to throw its fair share of commerce to our country.

The relations of the United States with other countries of importance are more cordial than they have ever been before. The relations of our exporters with their correspondents abroad are closer and heartier than we can recall on a previous New Year day. The demand for American manufactured products is greater, the facilities for supplying the demand are larger, and, taken altogether, the outlook is brighter, better and more satisfactory from every point of view than it has ever been before. America has the goods that are in demand. American's manufacturers and exporters can furnish them.

Our foreign readers probably care more about what America has to sell than about how Americans fare at home, but for those who take more than a trade interest in our country it is worth while saying something more. The internal commerce of the United States is keeping pace with the conditions to which we have just referred, and the prosperity of the country is greater than ever. Cabled reports sent to the European and possibly to the Australian countries have been misleading. Bad news everywhere travels faster than good news. The daily newspapers give much space to a murder and print it on the front page, while some great public benefaction or an important commercial event is made subsidiary to the criminal happening and found on an inside page. If mills close temporarily the news is heralded, but when operation is resumed the fact is usually overlooked, or tucked away in a corner where it cannot be seen. In the last three months of the year just ended many mills have suspended operations for a brief period in the United States, some have reduced wages before resuming, but others have gone on and have voluntarily paid their operatives higher wages. In the steel industry there has been an adjustment of the differences between the supply and demand. THE AMERICAN EXPORTER last February showed how inconsistent some editors were in estimating the steel trade situation. Since then the great balance wheel of supply and

demand has been working regularly, and the mills that then had too much to do are now working on a normal output of products, while other mills that were not bearing their fair share of the burden are now having more work than they were then doing.

During the year just closed there have been no important labor troubles affecting the foreign trade of the United States. The city of New York was tied up, so far as building operations were concerned, for nearly half the year by strikes of iron workers, but outside of that industry the effect was of little consequence. In general trade internally the country was more prosperous than ever, proving conclusively that even the idleness of 50,000 or 100,000 workers in a great city cannot check the onward movement in the new era of prosperity of the country. However all this may be, it is a fact, nevertheless, that the manufacturers of the United States were never better equipped to supply goods to their foreign customers than they are in this new year of 1904, and we believe that our readers not only realize the fact, but that they will act intelligently, as they invariably do, in pursuing their business course in the new year. To each and all of them THE AMERICAN EXPORTER wishes a happy and prosperous New Year.

1903 A RECORD-BREAKING YEAR.

THE foreign commerce of the year just ended was the largest in the history of the United States, the aggregate amounting to nearly \$2,450,000,000, as against \$1,714,066,116 in 1893, \$1,547,020,316 in 1883 and \$1,164,616,132 in 1873. The Government reports also show that our commerce with the non-contiguous territory of the country was much larger than ever before, not taking into account the gold ore of domestic production which was received from Alaska during the year. The manufacture of money in the way of coinage at the Government mints was larger than ever before and in many lines of industry enough information is available at this time of writing to show that the country generally enjoyed a more prosperous era than it had previously experienced, while the bad reports were fewer and of less importance.

A greater number of foreigners came to our shores than has ever been recorded in the history of the country and we believe that a larger proportion than usual will become useful citizens and aid in the development of our great resources. This condition would indicate that the possibilities of life in America are becoming better understood in other countries, just as the merchants abroad are acquiring a better knowledge of the excellence of the manufactured articles which enter into our export trade. From many new sources during the year came information of the growing realization in other countries that American manufacturers make their goods for practical use as well as for sale, and that their wares cannot be excelled for durability or reasonableness in price. This is particularly true of our agricultural and farm implements, but it is by no means confined to any particular line. The year was a record-breaker in trade, both in the domestic and export markets, and our merchants and manufacturers are to be congratulated.

PRAISE from Sir Hubert is praise indeed, according to an old saw. Purchasers of American goods everywhere in the world will be interested in the extracts which we print on another page in this issue from the recent report of Henry Birchenough, the special commissioner of the British Board of Trade who has been studying trade conditions in South Africa. Mr. Birchenough is marvelously frank in his commendation of American goods and commercial methods and there is a sincerity in his expressions of opinion and in the strength of his conclusions that makes his report not only interesting but of great importance.

NEGOTIATIONS between Japan and Russia, at last accounts, were dragging along with a degree of slowness that seemed to tend toward a peaceful settlement of the dispute between the two countries. It seemed evident that Russia was disposed to place upon Japan the responsibility for a war, if all efforts fail to preserve peace. It is sincerely hoped by Americans that there will be no outbreak of hostilities.

BIRTH OF THE NEW REPUBLIC.

FROM a number of view-points the erection of the new Republic of Panama was one of the most important events in international political and commercial affairs that occurred during the year which has just ended, despite the fact that there were many other events that tended toward permanent peace and the consequent greater development of the commerce of the world. In our last issue we chronicled the recognition of the new government by the Government of the United States, and pointed out the effects that the political changes on the Isthmus of Panama would have upon the welfare of the world, but the birth of a new republic is not to be dismissed in a summary manner. American interest in the territory has been keen on account of the difficulties which Colombia threw in the way of the construction of the Panama Canal. The price offered by the United States to Colombia was concededly extravagant, but the American Government went almost beyond the extreme in its efforts to make the Isthmian Government and people feel that we were disposed to treat them more than fairly. Under the contract with the selling company, as was pointed out in *THE AMERICAN EXPORTER* last September, the question was raised, and never seriously disputed or controverted, that the United States having purchased all of the rights and concessions of the Panama Canal Company it was only a matter of courtesy that Colombia should be consulted at all, much less be paid \$10,000,000 for what some people were inclined to believe was really nothing beyond goodwill. However that may be, Colombia dallied for months with the offer, finally rejected it, and after the revolution, when it was too late, offered to let us have the privileges for nothing. It is really a situation with which an Aesop ought to deal.

The birth of the new republic, aside from its commercial interest, brought forth evidences of friendship from the foreign Powers that were particularly gratifying to the people of the United States. Germany, for instance, promptly recognized the new Republic of Panama as a sovereign and independent State. Baron von Dem Bussche-Haddenhausen, first secretary of embassy and chargé d'affaires, addressed a note to M. Bunau-Varilla, the minister from Panama, informing him that, the German Government having received his notification of the creation of the new republic and his formal assurances that Panama assumed and would execute all obligations contained in the treaties between Germany and Colombia so far as they affected territory over which Panama is now sovereign, his majesty, the Emperor and King, extended full recognition to the new republic and best wishes for its prosperity and long life. The course of the European Powers was undoubtedly due to the action of the United States Government in giving the baby republic a helpful guarantee that its existence would not be crushed by rivals. From no source did any objection come, except from the repudiated parent, Colombia. It is not necessary, however, to say much more. The world generally hailed Panama's birth as an event of political and commercial importance. It means that the great inter-oceanic canal will now be pushed to completion without unnecessary delay, and that the whole world will benefit more or less by one of the revolutions which frequently happen in the Central American countries.

STATISTICS DO NOT SCARE.

FIGURES are all very well in their way, but statistics do sometimes assume the guise of a nightmare. The latest attempt of the statisticians to scare people is to make estimates of how soon the supply of iron will cease. They argue that the world is using such enormous quantities, 30,000,000 tons annually being taken out of the ground in this country alone, that it will be not so many years before the end of the supply is reached. The fear regarding the future when there shall be no more iron to extract from the earth is a foolish fantasy, and does not concern practical, everyday business life. It is to be put in the same category with the dire happenings that will follow when the coal supply gives out, when fuel oil ceases to flow, when the forests have all been razed and the atmosphere is destroyed by some natural phenomena. Anybody who wants to do so can find plenty of trouble to borrow, but it is refresh-

ing to observe that the average wide-awake American has neither time nor inclination to weep over the woes that may be the fate of the people of the future. They live intensely in the present, and although they are not entirely unmindful of the future, they refuse to be scared by prognostications of what may happen to unknown mortals in distant futurity.

The treasures of Mother Earth are an unknown quantity, and discoveries succeed one another with such marvelous rapidity that there is no chance for guessing regarding the next of Nature's wonders that may be brought to light. There is no real reason for alarm over the fatal scarcity of anything that may be necessary to human happiness or mortal existence. A recent writer wisely says: "We do not scare very readily over the prospect of the failure of the world's resources in any direction. When it gets so that human beings cannot exist on earth they will probably cease to move on the planet, but it seems as if the generation living had much more occasion to be concerned about its own comfort, and wisdom, and virtue than about the prospects of health and happiness of those who may dwell in some distant period."

A REMARKABLE DISCOVERY.

AN other page we print an account of tests made by an American inventor who believes that he has discovered a process by which electricity can be produced direct from fuel, without the intervention of a costly dynamo. The tests were made in the presence of a number of newspaper men and scientific writers, and the experimental machine seemed to do all that was claimed for it. An unusual feature of the test was that the inventor had no secret to hide and not only explained the operation in detail, but took apart his machine, and, as he said, could only prevent others from enjoying the fruits of his discovery by the letters patent which had been granted. Electricians who were present seemed to be satisfied with the exhibition and commented favorably upon the frankness of the inventor, as contrasted with the secrecy usually thrown around new discoveries by the persons interested.

It remains, of course, to be ascertained whether the process can be made commercially profitable, and this will soon be determined by the construction of a large apparatus which will effectually demonstrate the success or failure of the discovery from a practical, commercial point of view. If it proves a success, it promises to revolutionize the electrical industry, for on a small scale it has been found to produce electricity much more cheaply than it can be done with the dynamos now used for the purpose. The cost of installation will be less, and if successful the new apparatus will eventually supplant the costly machinery now employed to produce the electric fluid. The possibilities are certainly great and the subsequent developments will be watched with interest. As is our custom, we will inform our readers regarding the fate of the process.

ONE of the features of 1903 was that what is called the crop-moving period was passed with less than the usual disturbance to the money market. This is a period that ordinarily gives American bankers much concern, for difficulty is usually encountered in supplying the necessary currency to move the crops. In 1903 the balance was so well-adjusted that there was practically no disturbance of money rates, and the supply of currency was entirely adequate. Our readers abroad who are not familiar with this crop-moving feature of American domestic economy will find it difficult to realize the importance of this incident in our prosperity, but they will better appreciate it when they are informed that in some previous years, before the present irresistible tide of prosperity began its flow, there were occasions when the crop-moving crisis came dangerously near to amounting to a money panic. This condition has been gradually changing for the better and it is a matter for national gratification.

THE new Panama Republic unquestionably made up for the time lost by Colombia in acting in the Isthmian Canal treaty matter. Panama hardly waited a minute.

WONDERFUL UNITED STATES DEPARTMENT.

THE report of the United States Secretary of Agriculture, presented to Congress last month, is a wonderful document in its scope, comprehensiveness and general interest. Persons who have not come in contact with the work of this branch of the Government can scarcely realize the diversity of the duties performed by its elaborate machinery. Pages of this publication could be filled with a mere enumeration of the practical efforts which are being made to give American producers the best scientific advice possible in growing their crops, marketing their output, dealing with insects and providing for the innumerable contingencies that the farmer is likely to encounter. Forest preservation, new methods of making turpentine, new markets for products, pure-food-law enforcement, the weather probabilities, agricultural export trade, physics and chemistry of the soil, the breeding of animals and a thousand and one other subjects are considered intelligently and exhaustively. New inquiries and investigations in every direction are being constantly started, and large farms and experiment stations are maintained. Agriculturists can learn from the department the best methods of farm management from every point of view; culturists of specialties in fruit, vegetables and grains can ascertain anything that may be needful for them to know in their efforts to succeed. New seeds and plants are brought from abroad and efforts are made to propagate them in this country. Our agents extend their search to Asia and Africa, as well as elsewhere, and the efforts of all are based on coming to substantial commercial results.

Mr. Secretary Wilson's report devotes considerable space to the discussion of silk-culture experiments, to which reference was made in *THE AMERICAN EXPORTER* several months ago, which are of renewed interest in view of the fact that a plant was recently erected near Sydowsaue, Germany, for the artificial manufacture of silk by a secret process. The German experiment is reported to be a partial success, the silk being soft in texture and creamy in color, although it has only one-third of the strength of real silk. The American attempt to increase the silk output is being conducted on different lines. An appropriation of \$10,000 was obtained, expert workers from France were secured and they are now operating the reels in the Department of Agriculture, which purchases from the raisers of the cocoons the product at current European market rates. The result of this experiment so far is reported to be satisfactory, and the officials believe that the silk industry will be successfully established in the United States, although its accomplishment must necessarily be slow. This is only one of the many fields of research in which the United States Government seeks to aid the inhabitants of the country in taking full advantage of the natural resources of the various portions of the Union. The department is unquestionably doing marvelous work in a multitude of directions.

BANKING conditions form a fair test of a country's prosperity. Since March 14, 1900, no fewer than 1,765 new banks, with a total capital of \$104,493,000 have been organized in the United States. During the year just ended, 533 of these banks were brought into existence, a really remarkable increase.

SOME idea of the extent of ownership of the stock of America's largest "trust," the United States Steel Corporation, may be gathered from the statement that the owners now number very nearly 100,000 persons. The whole number of outside shareholders of record at present is 74,086. There are 24,540 employees of the company who either own stock or have partly paid for shares which they have purchased, making the grand total of 98,626 individuals. This is certainly a remarkable showing for a concern which is alluded to as a "monopoly" or "trust."

UNITED STATES SECRETARY OF AGRICULTURE WILSON devotes some space in his December report to Congress to the increased exportation of American fruits to Europe. He records as a "notable event of the year" the inauguration of direct shipment of American winter apples to Paris from his Department.

GERMAN EMPIRE'S FUTURE.

AMERICANS generally have come within the last few years to hold Kaiser Wilhelm II in a much higher degree of regard than was formerly the case. It is not necessary to go into the reasons at this time, for an enumeration of them would require much space and many of them are freshly within the recollections of our readers. Cabled reports from Europe during the last two months to the effect that disease was likely to shorten the Emperor's reign were, therefore, received in the United States with real concern, especially among statesmen who take an interest in foreign affairs, and among our merchants who are engaged in international trade. Aside from his friendly attitude toward America and Americans, the Kaiser has displayed a world-wide broadness in his policy that has had a beneficial effect upon commerce everywhere, and his retirement from public life would be a serious loss to modern civilization, a fact that we believe is generally realized.

It is consequently gratifying to learn from such a trustworthy and well-informed source as the German Ambassador to the United States that the cabled reports were misleading and with little foundation in fact. On his return from a visit to the Kaiser in December, the Ambassador, Baron Speck von Sternburg, promptly set the rumors at rest. Speaking of the health of the Emperor he declared in terms of positiveness, which we quote for the benefit of our readers who have seen the disquieting reports, as follows:

"He was in excellent health when I left him, and in good spirits, too. He, however, speaks in a low tone, so as not to complicate his throat trouble. Those who are in a position to know all about him, feel no concern whatever over his condition."

The news Baron Speck von Sternburg brings is reassuring to those who have at heart the welfare of the world, both politically and commercially. In the latter connection it is worthy of mention that the United States heads the list of countries which furnish the merchandise imported by Germany, with a grand total for 1902 of \$216,841,800, or 15.7 per cent. of the total importations made by Germany in that year. In the same period the United States was third among nations purchasing from Germany and took 9.3 per cent. of the total exportations of that country. While the trade balance is in favor of the United States, it is interesting to note how prominently this country figures in Germany's foreign commerce.

THE award of the annual Nobel Peace Prize, \$40,000, by the Norwegian Parliament, to William R. Cremer, M. P., publisher of *The Arbitrator*, of London, for his work in behalf of international arbitration, was noted with much interest in the United States, for Mr. Cremer has visited this country three times in the pursuit of his mission and has presented memorials to the President and the Congress from members of the British House of Commons in favor of a treaty of arbitration between Great Britain and the United States. Mr. Cremer founded the International Parliamentary Conferences, which have met since 1888 at Paris, London, Rome, Berne, The Hague, Budapest, Brussels and Christiania, and he has been for nearly thirty years the secretary of the International Arbitration League, so that he may be said to richly deserve the high recognition which he now receives for his efforts in behalf of the movement for one of the highest accomplishments of civilization—universal peace.

AMERICAN coal miners have so far paid no attention to the discussion of a universal strike of all of the coal miners of the world, which was discussed at the Brussels convention of the International Coal Miners' Association. Such a strike would be a vast project, and its effect on commerce would be serious. It is not believed here that the European miners will undertake to carry out such a gigantic affair, and it is more than certain that the American miners will have nothing to do with it in any shape.

PRESIDENT ROOSEVELT, in his message submitted to the Congress of the United States last month, congratulated the country upon the steady progress made in increasing the efficiency of the American navy. There will be no departure from the present policy of the Government in this direction.

MACHINERY VERSUS MEN.

ONE of the great railroads, which has its terminals on the shores of New York's harbor, is about to make a departure in the use of labor-saving machinery that will affect 4,500 men. These men are now employed in handling coal, but the machinery that is to be installed will do the work of most of them more quickly and quite as well, at a great saving of time and expense. By using the new machinery a carload of coal can be turned nearly bottom upward and dumped into a coal barge or schooner. The operation of one machine will require the services of only four men, and will take only a few minutes, whereas to do the same work now it takes twenty men about four hours.

The new boat-loading machine consists of an iron framework thirty feet high. Inside of this is a powerful elevator, capable of lifting an iron car containing fifty tons of coal. When the car reaches the top, iron clutches are attached to the sides automatically, and then by other mechanism the car, platform and all, is turned almost bottom upward and the coal dumped into a chute leading into the boat. This chute is operated by machinery, and has swing enough to distribute the coal evenly into all parts of the boat, thus saving the expense of the "trimmers," now employed to level the coal.

It is estimated that the cost of unloading will be about one-third of what it is at present. Writers in the newspapers, who have commented upon the coming change, have enlarged upon the fact that 4,500 men will lose their employment. Not one writer has sought to show that in the march of American progress these 4,500 men will be otherwise provided for, nor has a solitary writer said a word about this innovation as being only one of many steps in eliminating man from competition with machinery, where the latter can do the work as satisfactorily as it can be done by the former. We have given more description of the machinery used than would be necessary in such a brief item of the change as would interest our readers under ordinary circumstances, but the development seems to be of more than common interest when taken in connection with the advance made in America within the last few years in labor-saving devices. In the iron and steel industry, for instance, it is not so many years ago that giant cranes, handling tons of molten metal when necessary, replaced the hundreds of workmen who struggled with small pots of the hot fluid. In other industries also machinery has been found to do the work of men to greater advantage. It would be a long recital to enumerate a tithe of the cases where even the workers now realize that labor-saving machinery was a Godsend to them in disguise—saying nothing about the benefits that the employers have derived from the change.

It may be argued that in the present case there is some little difference, but we have inspected foundries under the old conditions and have seen them in operation in Pittsburg under the new conditions. We have watched the New Jersey coal handlers at work unloading cars, and while we can only at this time assume that the machinery will properly do the work, as no great corporation is going to experiment in this direction on a large scale, it seems to us that the results will be found very much the same. The problem that seems to interest our daily contemporaries is only this: What will become of the 4,500 workmen? They only ask the question; they do not undertake to answer it in the light of similar changes in other fields of American industry where the test of national ability of adjustment of economies has been even more severe. Without going into statistics, we can say that in practically every industry in the United States where labor-saving devices have replaced large bodies of men within a short time after the change there was work enough for all of them. Trade increased, the demand for men was greater, the workers of intelligence received better wages in positions requiring more than manual labor, and those who were not cared for in that way found opportunities in the lower spheres through an increased demand for workmen in their own class in other fields growing out of the larger output of primary materials made necessary by the labor-saving machines.

While our readers are only incidentally concerned in the fate of the 4,500 men, it may be said that the new system will eventually

have the effect of keeping coal at a normal price, it will prevent costly strikes, it will indirectly increase the demand and most of the workers will find employment at the mines, where they will receive better wages, if they care to do more than boys' work, while those who remain to take care of the machines will be paid higher wages than they have been receiving for doing mere manual labor. It may take a few months for the adjustment to become fully operative, some few of the less willing and intelligent workers may suffer, but, on the whole, the 4,500 workmen will be in a degree better off a year from this January 1st than they are to-day.

In the battle of Men vs. Machinery, there can be no final victor except the Men. So long as perpetual motion is an unsolved problem that will always be the situation. It is the experience in America that every successful labor-saving device has created fresh and renewed demands, that industries affected by it have soon required the services of more men to run the machines than were previously needed to do the entire work. This is true in so many fields that it is hardly necessary to particularize. It is a feature of American progress and a very important one.

NEW BRITISH MINISTER.

MUCH interest has been aroused in America by the report that the salary of the British Ambassador to the United States has been raised from \$30,000 to \$50,000 a year. The former salary was paid to the late Lord Pauncefote and to the late Sir Michael Herbert, who previously represented Great Britain in America. The new minister, Sir Mortimer Durand, is credited with receiving the higher salary, and if the report is true—we have seen no denial of it—it is of much greater importance, politically and commercially, than surface indications would seem to show. The British Minister to this country is given a fully furnished residence at Washington in addition to his salary, and if the latter allowance has been raised to \$50,000, it puts him on a par in both respects with the President of the United States, a remarkable thing, to say the least. It also makes him the highest-paid diplomat in America.

There are other considerations, however, of more moment than those we have mentioned. In order to realize the full force and importance of the change it is necessary to bear in mind that the British Ambassador in Paris receives \$45,000 a year and a magnificent official residence, which was formerly the palace of Princess Pauline Borghese, the beautiful sister of the first Napoleon. The British Ambassador at Berlin has \$40,000 and a residence, the Ambassador at Rome has \$35,000 a year and a residence, the Ambassador at St. Petersburg \$38,000 a year and a palace, while the Ambassador at Constantinople has \$40,000 a year, and not only a palace in the city, but also a beautiful suburban palace at Therapia. It will be seen, therefore, that the embassy at Washington is advanced from last in this list to the first position, and it is fair to assume that change of rank goes with the increase of salary, demonstrating that the British Government has come to attach a new value and increased importance to the American mission. We have often referred to the fact that the relations between Great Britain and the United States have been rapidly growing closer, and this official recognition of the increased importance of the position of Ambassador to this Republic serves to give fresh evidence that the changed conditions are fully appreciated in the proper quarters.

The new minister has already presented his credentials to the President and has been accorded a reception befitting his rank. From what we have learned about him we have no doubt of the fact that Sir Mortimer will prove a valuable representative of his government and will be an important factor in continuing the present policy of increasing the cordiality of the trade and diplomatic relations between the two Powers. He certainly begins service at Washington with the heartiest good wishes of all Americans.

THE value of the closer relations between the United States and Hawaii is shown in the fact that in the thirty years that have elapsed the sugar production of the latter has increased from 23,129,101 pounds to 840,000,000 in 1903. Much of the gain has been within the last decade.

AMERICA'S BIGGEST BRIDGE.

Great Function Made of Opening of New Structure Connecting New York Boroughs.

NEW YORK is growing greater in every way, and the last month of the year just gone saw the culmination of an enterprise which brought one of its boroughs into closer connection with the old New York City on Manhattan Island. Brooklyn, across the broad East River from New York, used to be a big city, but New York absorbed it a dozen years ago, and bridges and tunnels are in progress which will tend to wipe out the physical dividing line. In fact, there are some enthusiastic people who foresee the day when the big East River will be filled in and bridges will simply become elevated railroads, while tunnels will do the work done by the tubes in London. More thoughtful people do not believe that the East River will ever change its course unless a convulsion of Mother Earth occurs. However that may be, a new bridge was opened between the two boroughs of New York City on December 19th that was an event of national, as well as municipal, importance. The new bridge is the greatest of its kind in America, probably in the world.

The opening of the bridge was made the occasion for decorations and pyrotechnics on a grander scale than has ever before been planned by New York City. The day show was a spectacle of the structure with its webbing fairly hidden in bunting, flags and the green of the hemlock. But the night exhibition surpassed everything that the pyrotechnist had achieved before. Thirty-five thousand flags, some of them 50 feet long, were used in the decoration of the span and approaches, and 15,000 feet of natural hemlock boughs twisted into ropes entwined the lower towers and parts of the approaches of the span. At each of the entrances stands of colors filled the air with red, white and blue, and each upright was hidden in a mass of patriotic hues.

The grand stand in the middle of the span was draped with tricolored bunting and American flags from every point where one could be made to wave. About its uprights were entwined ropes of hemlock, making it a bower of green. The speeches were made from under a canopy of big American banners.

At night the entire structure, from anchorage to anchorage, across the great span over the river, and the ends of the approaches, were outlined in incandescent electric lights. There were about 20,000 of these, and they sparkled from the main cables and all the hanging parts of the huge web and outlined every girder and brace of the lattice-work towers from their foundations to their apexes. It was a magnificent spectacle.

At each approach were electric stars made of huge clusters of incandescent lamps, and the coat-of-arms of New York City was displayed in colored lights over each entrance. In the center of the span, directly over the middle of the river, was shown an immense American flag in colored electric lights. Supplementing the electric display was a show of fireworks that lasted an hour. The chief figure of this exhibition was a set-piece, representing Niagara Falls. This was 1,000 feet wide and the fall was from the roadway of the span to the river itself, a distance of nearly 140 feet. The falls were represented as never before in fireworks. Topping this cataract of fire, and shown above the main cables at the same time in pictures of fire, were the faces of five men prominent in the work of constructing the bridge.

The new bridge is the second of a series between the two boroughs, but it is so much larger than its twin brother close by that although the latter was for years a world's marvel, the new and larger bridge almost eclipses it. In comparing the greatest bridges of the world—and it is only possible to arrive at an estimate of the proportions of these enormous structures by comparing them with one another—it is difficult to make a general statement of superiority, inasmuch as one may have a larger span, another greater foundations, one higher towers, another greater carrying capacity. But in the one true test, that of capacity for traffic, the new East River bridge is by far the greatest of its kind in the world.

Its main span, 1,600 feet between towers, is only a few feet in excess of the Brooklyn Bridge, which is actually greater in over-all measurements, its distance between anchorage and anchorage of 3,455 feet being several hundred feet greater than the East River bridge. But the total length of the new structure is 7,200 feet, and its extreme width is 118 feet, while that of the Brooklyn Bridge is only 85 feet. This great width provides two 20-foot roadways for vehicles, four trolley car tracks and two elevated railroad tracks, while above the trolley tracks are two 18-foot roadways, separated into bicycle and footpaths.

The foundations of the new bridge consist of timber caissons, filled in with concrete, above which rise piers of limestone to water level. Above water the limestone has a granite facing. On these piers rest the steel towers, each weighing 3,048 tons. Most imposing are the anchorages for resisting the pull of the cables which sustain the enormous weight of the bridge. These structures are 182 feet in width and 158 feet in depth. Forty feet of the mass is below the street level, above which they rise to a height of 80 feet.

In each anchorage are 1,500,000 feet of timber, 10,000 cubic yards of concrete, 45,000 cubic yards of stone masonry and 1,700 tons of anchor steel. With a total pull from the four cables of 20,050 tons, rotation of the anchorages had to be provided against, and this was done by making the forward part of the structure hollow and massing the masonry at the rear. The four enormous

steel cables supporting the great structure, and which have a carrying capacity double that of the Brooklyn Bridge cables, are made up of thirty-seven strands, each strand containing 281 wires. There are, therefore, 10,397 wires in each cable, or 41,588 in the four cables. According to specifications, each wire had to possess a breaking strength of 200,000 pounds to the square inch and be capable of being coiled cold around a rod of its own diameter without breaking. The most elaborate precautions were taken to prevent oxidation, and all the wires of each cable strand are spliced to form one continuous wire. Over each cable is a covering plate of steel.

Translating the tonnage capacity of the new bridge into persons, it is found that 128,000 passengers an hour can be handled on the new structure, 70,000 on the four trolley tracks, which can accommodate 350 trolley cars in that time, while 58,000 can be handled by the elevated trains. The cost of the bridge was \$15,000,000.

Chinese to Print Newspaper in New York.

ONE of the signs of the times in cosmopolitan New York City is the new project to establish a Chinese newspaper in this community. Tong Chew, a young Chinese reformer from one of the first families in the Flowery Kingdom, arrived in New York last month to fill the position of editor-in-chief of the paper. The newspaper, the first issue of which will appear on the Chinese New Year—February 16th next—is to be published by three wealthy Chinese merchants in New York, and will be the official organ of the Chinese Empire Reform Association, the largest political society in the world, having a membership of 5,000,000. The object of the association is the complete remodeling of the present form of government by education and the modern methods of the civilized countries of the West.

Tong Chew, at the time of his call here, was an instructor in one of the reform colleges at Yokohama, the Dai Tung Hok Hoh. For some time the members of the Chinese Reform Association in New York have been anxious to have an official organ here. During the stay here of the two great leaders of the reform movement, Choy Se Kan and Leong Kai Chui, last spring, they made 11,000 converts of the 20,000 Chinamen hereabout. There were then 3,000,000 active members of the association. The number has since nearly doubled.

The paper will be first published as a weekly, but will probably be soon changed to a daily, with a full staff of editors and reporters after the latest methods of metropolitan journals, and complete daily reports by cable of the most important news from China and all the local happenings of interest to its readers. There will be advertisements, of course. The size of the new paper has not yet been determined upon, but it will probably be eight pages of seven columns each. The press and printing plant are now on their way here, and the Chinese printers will soon start for this country. The office will have all the latest newspaper appliances.

The work of publishing a Chinese newspaper will be appreciated when it is known that there are 50,000 separate characters in that language, each word having a symbol for itself. It is not absolutely necessary to use all these characters, but at least 20,000 must be employed to properly represent what a writer desires to say. The article is read from the top downward in narrow columns, one character directly below another.

The name of the paper will fitly express its object. Its main feature will be editorials appealing to Chinamen in America and the mother land to join the reform movement. The price will probably be so low that all may buy it. The daily will likely be sold for 1 cent. It is expected that it will circulate not only in this country, but in China. The one daily Chinese paper published in the United States is the *Chinese Daily World* of San Francisco.

The new editor, Tong Chew, who is only 24 years old, has been educated on the lines in vogue in American colleges and speaks four or five languages other than English.

America as a Nation of Advertisers.

FRANK PRESBREY, of New York, vice-president of the Association of American Advertising Agents, in a recent lecture on "The Evolution in Advertising," gave advertising much credit for the success of the American nation, from a business standpoint, maintaining that people cannot buy what a dealer has for sale unless they know that the article exists, advertising being the means of conveying that information. Mr. Presbrey said in part:

"Advertising is as old as the human race, but it has two histories—the history of advertising as an institution and its history as an art. The history of the art of advertising began recently, but advertising proper runs back through the ages and into the haze that hides the beginnings of humanity.

"Advertising in our own country began with the establishment of newspapers, and America may fairly claim to have developed advertising as an art. The development of advertising is very recent—a matter of less than twenty-five years. Advertising has wrought a revolution in the periodical literature within the last two decades, and has brought down the cost of our newspapers, giving us more of them and enlarging their circulation and influence.

"We are a nation of advertisers. America also leads in the excellence of advertisements, from an artistic, as well as literary, standpoint. It is one of the modern manifestations of a part of our machinery for living, and it is improving the lives of the masses by cheapening luxuries and teaching their uses."

OUR AUSTRALIAN TRADE.

Delightful View of the Country Taken by an American Newspaper Correspondent.

FRANK G. CARPENTER, the eminent American newspaper man, who has been investigating American trade conditions abroad, writes interestingly in the *Washington Star* of our trade with Australia, which, he says, is "advancing by leaps and bounds, but the market is appreciated by only about two score of American firms, who do most of the business." Mr. Carpenter adds: "The field is open to all. The Australians are the nearest like Americans of any people on earth. They have the same wants, and, more than that, they have the money to satisfy them. They have more than \$150,000,000 in their savings banks alone, or on the average one such account for every family. In New Zealand every family annually takes about \$25 worth of American goods, and in the province of New South Wales, the greatest of the Australian States, the sales of our goods amount on the average to \$50 per family. Think of a State where every man, woman and child is annually consuming \$10 worth of our products, and you get some idea of the favor in which our manufactures are held there. I say manufactures, for that is what Australia buys. It produces the same raw materials that we do in the shape of wheat and wool and the precious metals, and it has no great factories and mills to eat up our cotton, iron or coal.

"Indeed, the Australasians spend about as much money as any people on the face of the globe. The minimum wage in many parts of the country is \$1.70 a day and in others it is \$2 a day and over. The wages of mechanics are high, and altogether the people are as well paid as any on earth. In addition to this the Continent is run on the eight-hour basis. The people have plenty of leisure and many holidays, during which they spend money, and, as a result, they have a foreign trade of enormous proportions in comparison to the population. This trade amounts to about \$800,000,000 a year, and that for a people who number just about 5,000,000.

"I wish I could take you to the New York of Australia and show you the enormous ships lying in the harbor. There are 10,000-ton vessels from London, Hamburg, Marseilles and the other great European ports and smaller vessels from India, China, Japan and the islands of the south seas. There are 6,000-ton boats from San Francisco (U. S. A.) and vessels of equal size from South Africa. Sydney has already 500,000 people and it grows like the beanstalk up which little Jack climbed to fight the giants. Sydney stands about third among the great British cities in trade. It is only exceeded by London and Liverpool, and it does more business than Havre, the chief port of France. Several American firms have houses in Sydney and transship our goods from there to all parts of Australia.

"But what do we sell away down there below the equator? A recent shipment of one of the big San Francisco steamers included 400 tons of sewing machines, 1,000 tons of fencing wire, 400 tons of roll paper and 80,000 cases and 1,500 barrels of kerosene. There were also rifles, guns and revolvers, tons of Philadelphia lawn-mowers, Chicago reapers, wagons knocked down, coffee mills and all sorts of patent medicines. Another cargo arrived about the same time, bringing twenty-four locomotives from Wilmington, Del.; 700 tons of paper and 4,000 tons of other manufactured goods. This last shipment was valued at \$1,000,000.

"About two years ago I traveled over the greater part of eastern Australia. I found our reapers and mowers for sale in every town and was told that the Australians liked our farm tools. So far only the heavy agricultural machinery is being properly pushed. Our implement firms work Australia as carefully as they do their home territory, and they have to fight for every inch of ground with the Canadians and European exporters. Nevertheless, they have the bulk of the business and they make a good profit.

"The same should be the case with the lighter farm tools. All sorts of farm implements, plows, hoes, forks and rakes might be sold in large quantities, as well as every class of American goods made of iron and steel. Our carpenter tools are popular. Seven-tenths of all the saws used in that part of the world come from the United States, and the American ax is considered the best in the market.

"Among the biggest purchasers of Australia are the colonial and municipal governments. They control the railroads and buy in quantity for both the electric and the steam roads, so that our steel trust agents can make big sales if they know how to work the officials. As it is now, American engines are used on many of the lines and some tracks are laid with American rails. There are a few Pullman cars and other kinds of American rolling stock. Australia has now about 13,000 miles of tracks and the governments are pushing the roads in different directions to develop the country.

"Government sales can also be made in New Zealand, where American goods are especially favored because of the speedy filling of orders. The English manufacturer wants a year's time to supply a given number of engines, while the American will furnish them within a month or so after getting the order. This is so as to bridges, dredges and the materials for public works.

"The Australian field is about the easiest to work of all the fields washed by the Pacific Ocean. The American who goes to China, Japan or other countries is bothered by the languages and the strange customs of the people. Australia is a second America. Business is done there in about the same way as at home, every one speaks English, and special favors are given to commercial travelers. On most of the railroads reduction of 20 per cent. is made

on commercial travelers' tickets, and there is a special rate for their baggage. At the hotels they are charged but \$2 per day, and they are usually treated with greater respect than other guests.

"In all the larger cities of Australia and New Zealand you will find some Americans. Melbourne especially has many, whose fathers came in from San Francisco when gold was first discovered. Some of them made fortunes. They engaged in business, and to-day Melbourne is called the Yankee city of Australia. A large number of Australian cities are now equipped with American street cars. American shoes are sold in Sydney and Melbourne and American shoe stores, such as are now being established in Europe, could be run in Brisbane, Sydney, Adelaide and Auckland at a profit."

American Implements in Paraguay.

IN our last issue we mentioned the fact briefly that considerable interest is being manifested in American agricultural implements in Paraguay, and printed a request that catalogues be sent to Moises S. Bertoni, the director of the Government's agricultural college. Since then we have received a report from John N. Ruffin, the United States Consul at Asuncion, where the college is located. Consul Ruffin says that he has had a conversation with Dr. Bertoni, in which the latter expressed a desire to have American manufacturers of agricultural implements, such as plows and machinery of different classes, send him catalogues, etc. Dr. Bertoni said he would be glad to exchange correspondence on these matters, which are of such great importance to Paraguay at this moment. He further states that a great many plows which go to Paraguay are not adapted for plowing the peculiar soil of Paraguay, and in consequence made trade unfavorable in the districts where they have found their way. If suitable plows were sent to the agricultural districts they would sell readily. Dr. Bertoni stated that, owing to the scarcity of labor, Paraguay will be forced to buy largely of agricultural machinery. He is at the head of the National Association of Agriculturists.

Equal Chance for Foreigners in Manchuria.

IN discussing Russia's commercial relations with Manchuria, *Boyd's Commercial Guide for China* (Shanghai) makes the following comment of interest to American exporters and the traders of other nations:

"Despite her great railroad, Russia has no real advantage over the foreigner. Under the present conditions of the road no bulky cargo can pay for its transportation, and even under proper conditions the major part of the freight will go by sea. For instance, glassware, tobacco and other lines of merchandise cost 1 rouble (2s.) freight per pood (36 1/12 pounds) by sea from Odessa, but over 2 roubles via the Chinese Eastern Railroad. As a matter of fact, foreign goods have been in Manchuria for three years, at least, and are so favorably known that efforts are already being made to counterfeit the more prominent articles. Russian settlements are springing up in northern and northeastern Manchuria, but the wants of these people are not extensive. It is, therefore, problematical whether the Manchurian market will become a larger consumer of Russian goods. It will depend more on the lack of enterprise on the part of foreign merchants than on the superiority of Russian methods."

United States Trade with New Zealand.

A GRATIFYING increase in exports from this country to New Zealand is shown by the statistical returns for 1902, which record an amount of \$6,594,685, as compared with \$3,876,545 in 1899. A few items, which are mentioned by *American Industries*, are instructive. Shipments of boots and shoes have increased during the period covered about 420 per cent., while cotton piece goods were exported in nearly twelve times the quantity of the earlier year named.

The typical New Zealander has evidently not had time to think about his journey to London, to view the ruins of St. Paul's, for besides distributing American goods, he has been hard at work improving the quality of his hemp and last year shipped to his American friends more than four times the quantity furnished them in 1899, while almost doubling the exports of wool and sheepskins in comparison with four years ago.

Pays to Satisfy Customers' Requirements.

SOME remarks addressed to English houses by a correspondent of the *Sydney Morning Herald* are not without interest to American manufacturers. The writer (a West Australian dealer) complains that owing to the unwillingness of English makers to carry out special instructions in putting up canned goods and mustard, he has been obliged to take up German articles, which have now superseded the respective British products. Lumber in special sizes, which no English sawmill would furnish, he got without difficulty from America. The writer concludes by telling his fellow-subjects that if they attended to customers' wants they would not require preferential tariffs to help their colonial trade.—*American Industries*.

Novelty in Shoes.—A novelty in the American shoe trade is a white shoe with black straps and trimmings. This is said to have originated in the city of Chicago. Opinion is divided as to whether or not a combination of colors in shoes will ever catch the popular favor to any important extent.

"1900" Washing Machine

AND ITS PARTS.

Interior view, showing clothes in process of washing.

Looking under Bottom of Washer.

Inside view of Tub and Bottom of Agitator.

Shows Washer with the tub removed from the frame and the agitator or disk which rests on the clothes and water during washing. It also shows the wringer in position as when in use.

"1900" Washer.

"Domestic" Washer.

"Home" Washer.

"1900 Junior" Washer.

"1900" Washer.

A Remarkable Record!!!

Reward of Merit!!!

Commencing in the year 1900 to manufacture the "1900" Washing Machine, we at that time "turned out" an average of Five Washers per day. During the month of August, 1903, we manufactured and sold OVER FOUR HUNDRED Washers per day.

A Remarkable Record!!!

Reward of Merit!!!

The "1900" Ball-Bearing Washing Machines are the embodiment of the results obtained from over twenty-one years' practical experience in the making of washing machines, and, unlike any other washer upon the market, **do not tear and wear the garment**, but by the adoption of our **agitator** tosses and tumbles the garment through a **whirlpool of water**, thus **forcing the water through the finest or coarsest fabrics**, causing the clothes to become **ABSOLUTELY CLEAN**, without boiling or scrubbing, without wear or tear, and without the use of chemicals.

Special Offer for Foreign Markets Only:

\$22.75

Upon receipt of **Twenty-two Dollars and Seventy-five Cents** in U. S. gold, or its equivalent, we will box, ready for steamer, and deliver F. O. B. cars at New York City, **One of Each (Four in All), "1900," "1900 Junior," "Domestic" and "Home" "1900" BALL-BEARING WASHING MACHINES.** Weight of the four machines, boxed, 340 pounds.

To facilitate our increasing export trade we desire to communicate with one responsible business house in each trade center of the world.

Tens of thousands of the "1900" Washing Machines have been sold in the United States, as well as in all parts of the world. Many of our agents at home are making over \$200 per month. Live men in your vicinity can do as well.

Orders received direct or through export houses; when ordering through the latter, to avoid errors, please mail us a duplicate of order. Our Illustrated Catalogue mailed postpaid.

The "1900" WASHER COMPANY
BINGHAMTON · NEW YORK · U.S.A.

MARVELOUS DEVELOPMENT.

Trade in Candy, Not a Necessity, Grows from Nothing to \$150,000,000 a Year in 25 Years.

A STUDY of the candy industry of the United States made by the New York Times gives some idea of the wonderful development of the United States in lines of trade which do not involve the necessities of life. Within twenty-five years the candy industry has increased from almost nothing to about \$150,000,000 a year. A quarter of a century ago there was not an exclusive candy manufacturer in a large way of business. The candy manufacturers of those days usually made crackers or similar sweetmeats, together with cigars and other goods of that character. The candy manufacture of twenty or more years ago was confined almost exclusively to kisses, stick candy, lozenges and gumdrops. To-day the varieties run into the thousands, from a cheap gumdrop to a high-priced chocolate. The proportion of high-priced goods has increased very largely of late, and cheaper grades of confectionery are no longer purchased in any quantity by a majority of consumers. Perhaps twenty years ago a man who employed careless or wilfully dishonest methods could succeed, but that time has passed, and the manufacturer who doesn't make pure goods can no longer sell them, excepting in a small way, and the pure food laws will interfere with his operations in almost any State in the Union.

According to what may be assumed to be substantially reliable figures, candy costs the people of the United States about \$150,000,000 a year. In 1890 the output was \$81,290,543, and in 1880 \$25,637,033. In 1880 there were 1,450 establishments making candy, which had increased in 1900 to 4,297, while the capital invested increased from \$8,486,874 in 1880 to \$35,155,361 in 1900.

New York is preeminently the candy city of the world. It has more establishments engaged in its manufacture and more stores handling it than any other city on earth, according to the Times. The output of England, France and Germany is not as large as the output of the United States, and probably New York City alone produces more than either one of the three countries alone. The iron and steel outputs of New York State together do not equal in value the candy output, indicating that the business has assumed the proportions of a giant among the manufacturing industries, and the increase has been so rapid that it is scarcely comprehended by the public.

A generation ago candy was looked upon by austere people as entitled to consideration only as an indulgence of childhood. Ruin to the teeth, impairment of the digestion and general derangement of the system were popularly supposed to be the rewards of candy eating. Physicians strengthened this conclusion and prepared and published elaborate essays against the consumption of confectionery. That view of the situation has passed away. Accurate scientific investigations, extending over a large series of years, and observations under widely varying conditions, prove that candy is highly nutritious and is a valuable food. After usual muscular exertion there is a strong craving for sugar, and observations conducted by war departments in several countries prove the efficacy of candy as a food suitable to maintain the strength under very strenuous and ordinarily fatiguing circumstances. Experiments made in South Africa during the Boer war demonstrated the practicability of a diet of jams, chocolates and other confections when troops were compelled to make long and severe marches.

Nearly every process of manufacture is now carried on by machinery, and an experienced manufacturer said to a Times reporter that within a few years it will be unnecessary to touch the hands to candy at all. Every operation will be done by machinery. Naturally, this improves the quality, because nothing is so inconstant as the human hand, and all processes of confectionery making require constancy, otherwise variation will creep in.

Increased Export Demand for American Carbon.

AN American engaged in the trade reports that there is an increased demand in Europe and in other parts of the world for American blacks, the carbon products used largely in printing ink, varnishes and various manufacturing lines. This gentleman returned recently, after a trip to Great Britain and several of the Continental countries, and while abroad he closely observed the conditions affecting the American carbon business. His firm has houses in London and Paris and branches in other European cities.

"England, France and Germany are our best customers," he said. "The American manufacturers control the markets for blacks made of natural gas, because nowhere outside of this country is the natural gas available. Notwithstanding this fact, the German lawmakers have enacted a tariff provision increasing the duty. The measure was designed to reduce our exports, but does not accomplish this, because the Germans must buy the blacks here or do without them. The only effect, therefore, is to increase the price to the German consumers.

"Within three years our house has built up, not only a domestic, but a foreign trade in decolorizing carbons. Germany until recently supplied the world with this product. Not much was known outside of that country as to the process of making the articles. We make it now from animal carbon and have been quite successful in wresting a fair share of the trade from Germany. We are even selling in Mannheim, in that country. The article is

largely used there in the works at which quinine is refined. We have also begun to supply some of the refiners in Paris, who are noted for the excellence and purity of their drug.

"Another use of this kind of carbon is in decolorizing wine. For this purpose the consumption has increased enormously in recent years. Millions of pounds are used annually in France in changing red wine to white wine. The flavor is not altered and the process is absolutely harmless. Our carbons are also used in refining cream of tartar, morphine and other chemicals."

Great Gain in Our Trade to Various Countries.

THE value of South Africa as a market is the subject of some special attention at the present time, by reason of a report upon that subject recently presented to the British Parliament. This report shows that the British colonies in South Africa have become of greater importance than any other of the British colonies except India.

"Ten years ago," it says, "Great Britain's exports to South Africa were valued at a little under £9,000,000; last year they almost reached £26,000,000. In 1893 South Africa stood sixth on the list of Great Britain's customers; last year she stood second, and was only beaten by India. It is no rash prediction that this year she will pass India and stand first on the list as the largest buyer in the world of the produce and manufactures of the mother country."

This statement of the great advance and rapidly growing importance of South Africa as an importing country lends especial interest to some figures just prepared by the Department of Commerce and Labor through its Bureau of Statistics, showing the growth of exports from the United States to British Africa and to Africa as a whole. These figures show that the exports from the United States to British Africa have grown with even greater rapidity than those from the United Kingdom.

Exports from the United States to British Africa grew from \$3,688,999 in 1893 to \$33,844,395 in 1903, or, in other words, were nine times as much in 1903 as in 1893, while exports from the United Kingdom to South Africa grew from \$39,896,000 in 1893 to \$125,280,000 in 1902, the 1903 figures not being yet available. Thus, while exports from the United States to British Africa are in 1903 nine times those of 1893, those from the United Kingdom were in 1902 but three times as much as those in 1893.

The total exports from the United States to Africa have grown with great rapidity—from \$5,196,480 in 1893 to \$38,436,853 in 1903, being more than seven times as much in 1903 as in 1893, while to Asia and Oceania our exports grew from \$28,064,038 in 1893 to \$95,827,528 in 1903; to South America from \$32,639,077 in 1893 to \$41,137,872 in 1903; to North America, other than the United States, from \$119,788,889 in 1893 to \$215,482,769 in 1903, and to Europe, from \$661,976,710 in 1893 to \$1,029,236,657 in 1903.

Air Power Runs Miniature American Railroad.

TWO miniature railroads, fully equipped for the business required of them, are in operation in Milwaukee, U. S. A., one at the Menomonee Valley plant of the Milwaukee Gaslight Company and the other at the works of the Milwaukee Cement Company.

The line at the gas works is a novelty in many ways, one of the most interesting features being that the locomotives are run by compressed air. The tiny locomotives are equipped with powerful "boilers," which are, in fact, air tanks, capable of withstanding a pressure of 1,000 pounds to the square inch. Air is applied by means of a compressor at the plant, from which a pipe line extends along the entire system. Whenever the air gauge shows that the pressure is becoming low the engineer stops at a hydrant and air is pumped into the tank sufficient to run for a considerable time.

Unlike many miniature locomotives, those at the gas works are driven in exactly the same manner as a steam locomotive. The power is transmitted to the drive wheels directly from the cylinder by means of the usual driving rods. The engine-driver's cab resembles the cab of a mogul engine, but the interior is much different. There is no heat, no stoke-hole, no water-gauge, no blow-cocks and no fireman. The system is two to three miles long, counting the sidetracks and spurs that reach into every part of the mammoth plant. The line is equipped with tiny flat cars, gondolas, dump-cars and special cars used in transporting coal to the fire-rooms and to the retorts.

At the Milwaukee Cement Company's plant the railroad is equipped with steam locomotives and tiny cars hardly larger than a wheelbarrow. This line extends from the mills to the quarry, where the rock from which the cement is made is procured.

Quick Work in an American Factory.—A factory at South Haven, Mich., U. S. A., makes about 2,000,000 ordinary peach baskets every year, 150,000 berry crates, 1,400,000 berry boxes and between 80,000 and 100,000 bushel baskets. Logs go into one end of the factory and come out baskets at the other end at the rate of 15,000 a day. Beech, elm, maple and basswood are used.

Important Patent Suit Decision as to Suspenders.—A decision has been filed in the United States Court upholding the validity of the MacWilliams patent upon "President" suspenders controlled by the C. A. Edgerton Manufacturing Company. This decision is of much importance to the trade.

NEW PRINTING PROCESS.

Wonderful Discovery of an American Will Replace Lithography at a Great Saving of Cost.

AN invention of a New York man, which he calls the lithotype, promises to revolutionize printing processes, for it involves the discovery that aluminium plates can be used in all the varieties of printing in which lithograph stone has hitherto been employed, and that the plates can be printed on fast rotary presses, instead of the slower flat presses. For the new process it is claimed that in facility it is 100 to 1 better than the old method and its cost is just one-twentieth.

For the uninitiated the present process of printing the modern daily paper may be briefly described. First, the matter to be printed is handed to the linotype, or type-setting machine, operator, who puts the manuscript matter into solid lines of type. This type is arranged in columns in a page and this is turned over to the stereotypers, who take an impression on a moist matrix of papier-mâché. This matrix is then dried out on a steam table and put in a casting machine, where curved metal plates are made from it. Each of these plates is a page, and when all are clamped on the cylinders of the big presses, the wheels revolve and the paper is printed direct from the raised metal surface of the plates.

This process marks an almost immeasurable advance over old methods of printing, and the linotype does its work of first setting and then distributing type with a precision once thought only possible for human fingers directed by human intelligence. But this process is greatly simplified by the lithotype. If it is developed along logical and apparently easily possible lines the newspaper of the future will likely come into being in about this fashion, according to the *New York Times*:

The machine operator, at a keyboard like a typewriter, will put the matter from the editorial pens on a strip of paper perforated by an electrical device to the resemblance of a record for an automatic piano. This perforated strip is run into a second section of the same machine, which translates the little holes in the paper into letters, words and spaces, which are printed directly on to the surface of a strip of paper treated by a special process. This strip of printed matter can be made of any width desired. When the column is complete the paper is pressed directly on the prepared aluminium plate, causing the ink to adhere to the plate. After the impression is made on the aluminium the paper is removed and the plate is fastened to the cylinder of the press, the wheels start and the papers come out printed directly from the smooth surface. There has been no type used except little dies, fitted in a receptacle, like a sewing-machine bobbin, in the second section of the lithotype.

The process of printing from a flat surface is vastly interesting, but probably familiar to not more than one person in a thousand. It is done on the simple principle that oil or grease and water won't mix. The designs to be printed from lithograph stone or aluminium plate are defined in ink, the basis of which is grease. Over the rest of the plate a roll, moist with water, is passed, and when the surface of the plate comes in contact with the paper nothing prints except that portion previously marked out in grease. The process, hitherto confined exclusively to lithograph work, may now by the use of the aluminium plate may be made available for use on fast web-perfecting presses such as are used now by modern newspapers.

The New Yorker who has perfected the whole new process says that the present style of rotary perfecting press can, with few changes, be adapted to the new method. These changes will be the addition of a water motion to correspond with the ink fountain and a change in the cylinders to accommodate the thin aluminium plates. The inventor is confident that his inventions will work great changes in printing methods, but he points out that new inventions, while largely taking the place of old devices, have never succeeded in completely eliminating old methods. On this point he contents himself with saying:

"The new process will largely reduce the use of relief plates, and will eventually and practically do away with the use of type. It will materially cheapen letter-press printing, and that means more printing. Every invention which has cheapened production has increased the output."

Regarding the saving of labor, the inventor says it will be at least 25 per cent. It will also cut down the demand for skilled labor. In fact, it is assumed that girls, having a defter touch, would be preferred above men as operators. The output of the machine has no limit except the capacity of the operator to manipulate the keys.

"By this method," says the inventor, "a printing plant will be reduced to the lowest possible cost. All that will be necessary for the outfit is one or more lithotypes, a press to transfer the printed slip to the aluminium plate, a grain-in machine to prepare plates and a rotary press."

New Methods in the Turpentine Industry.

THE discovery of a new way of extracting turpentine, made two years ago by Dr. Charles H. Herty, working under the direction of the United States Bureau of Forestry, is resulting in a complete change of methods by the turpentine operators of America, as predicted by *THE AMERICAN EXPORTER* last year.

In a bulletin published last spring by the Bureau of Forestry the claim

was made that the experiments with the new cup and gutter system of turpentine had resulted in an increase over the old boxing system of 23 per cent. in the amount of the product extracted. This figure has been now raised to more than 36 per cent. In other words, Dr. Herty's system, when universally adopted in this country, as it is certain to be, sooner or later, will have raised the turpentine production of this country by more than a third, provided the same number of trees are used.

Two years ago, when Dr. Herty first made known his discoveries, he put 20,000 cups into operation. Last year this figure was increased to about 400,000. This year a conservative estimate places the number of cups to be used at 3,000,000. The figures give some indication of the rapidity with which turpentine operators are adopting the new system. The change of methods has been so rapid that the pottery company which undertook to supply operators with earthen cups has found it difficult to keep up with its orders and has been obliged to refuse contracts for over two million cups. It is safe to say that the majority of the large turpentine operators in this country have given up the boxing system and will extract their turpentine by means of cups and gutters.

The economic saving of this new discovery is enormous. It not only causes a great increase in the amount of turpentine produced, but it is a most important factor in saving the pine forests of the United States. Every one knows that trees from which turpentine has been extracted by the old method—"boxed" timber it is called—soon die from the wounds inflicted on them. The cup and gutter system, on the other hand, is not fatal to the life of the tree, and does very little damage to the timber.

Mercury Vapor Lamp Proves a Success.

THE mercury vapor lamp invented by Peter Cooper Hewitt, son of ex-Mayor Hewitt, of New York City, which was described in *THE AMERICAN EXPORTER* several months ago, is reported by the *American Inventor* to be coming into popular use in the principal cities of the United States. It is appearing in New York factories and over in Boston it is rapidly coming into popular use. In Boston it is being used in warehouses, machine shops, factories, printing offices and places where great accuracy of sight is required. The lamp is much used by photographers, who say they can take pictures by it much more rapidly than they can by daylight. One of the advantages of the light is that it makes use of a current of high voltage, yet gives a steady illumination, where with another system the effect would be almost blinding. On account of its absence of red rays it is easy on the eyes and is well adapted to the use of those who work at night, provided their tasks have nothing to do with fine discriminations between colors.

Device Provides for Portable Ventilation.

IN no branch of Government service has the matter of ventilation been given such serious consideration as in the United States Navy. The construction of the modern vessel renders it extremely difficult to secure proper ventilation in some portions below the water line. Noticeable for its novelty among the various methods used to properly ventilate such places is an American invention called the portable ventilating set, consisting of a small exhauster directly connected to an enclosed electric motor. It is very light, moves a large body of air and is provided with handles for carrying from place to place, enabling the crew to work in any portion of the vessel with comfort.

Instruction in Machinery.—At a recent meeting of the Board of Trustees of the Iowa Agricultural College, located at Ames, Ia., U. S. A., a new branch of instruction was decided upon. It is a course of instruction in the building and operation of farm implements. It is to be conducted as a branch of the agronomy department of the division of agriculture, and will cover instruction in the use of all kinds of farm machinery and appliances. Professor Zintheo, who will fill the chair, has for the past year been in charge of a similar department in the North Dakota Agricultural College, the first of the agricultural colleges to introduce this class of work, and previous to engaging in the work of instruction Professor Zintheo was traveling for one of the prominent manufacturers.

Gain in Trade with Canada.—Commerce between Canada and the United States shows a rapid gain both in the figures of the year just ended and in those of the decennial period which ended with December 31, 1903. The year's commerce with Canada, as shown by the figures of the Department of Commerce and Labor through its Bureau of Statistics, will aggregate nearly \$200,000,000, against less than \$100,000,000 in 1893. Our exports to Canada, which in 1893 were \$57,000,000, in 1903 aggregated about \$130,000,000. Our total commerce with Canada has thus grown from \$91,000,000 in 1893 to approximately \$185,000,000 in 1903.

American Trade in Quebec.—Consul Charles Deal, at St. John's, Quebec, Dominion of Canada, reports as follows: "There is a marked increase in American goods kept by the merchants of St. John's, and they report an increasing demand for New York styles—the demand is for the latest styles and best qualities. Dealers sold \$12,000 worth of American agricultural implements this season."

Griffin Cleaner and Paste Combination

for Cleaning and Polishing Russet and Russia Leather Shoes and all Articles made of Russet and Russia Leather.

NOTE—Our Cleaner contains no Camphor.

Our Cleaner and Paste Combination for cleaning and polishing Russet and Russia Leather Shoes (and all articles made of Russet and Russia Leather) cannot be surpassed, if used according to directions. The Cleaner cleans and removes stains, and the paste produces a brilliant, durable waterproof polish, which is not sticky or gummy. We also make it in different colors, ox blood and brown.

Price per gross, large size.....\$14.00
Price per gross, small size..... 7.50
Discount, 10 per cent.

Our Parisian Dressing.

A Black Dressing for Ladies' Shoes. Is considered by good judges to be the best and nicest put-up 10-cent dressing on the market.

We guarantee it not to contain anything injurious to the leather. It contains oil which helps to keep the leather soft and pliable. Packed in one and three dozen boxes. Price, per gross, \$7.50. Discount, 10 per cent.

Griffin Sterling Combination

Our Sterling Combination for dressing and producing a gloss on shoes made of Box-Calf, Cordovan, Vici Kid, French Enamel and all fine dry black leathers. Cannot be surpassed if used according to directions. It is easily applied, polishes quickly and easily; its lustre is brilliant, durable and not sticky or gummy and will not crack or scale off. It keeps the finest of leather soft. We guarantee it not to injure the leather in the slightest degree, as it contains no acid or other injurious substances.

A circular in each package giving full directions.

Price per gross, large size.....\$15.00
Price per gross, small size..... 8.00
Discount, 10 per cent.

Griffin Russet Leather Polishing Paste.

Our Russet Leather Paste for producing a high gloss on Russet and Brown Leather Shoes (and all articles made of Russet or Brown Leather) cannot be surpassed, if used according to directions. It polishes quickly and easily; its lustre is brilliant, durable and waterproof, and yet is not a varnish.

Excellent for vici kid.

We guarantee it not to injure the leather in the slightest degree, as it is free from acids, and will not soil the finest of fabrics.

If the shoe is dirty is should first be cleaned with Griffin Russet Leather Cleaner.

Price per gross, large size.....\$6.00
Price per gross, small size..... 3.50
Discount, 10 per cent.

Griffin Patent Leather Polishing Paste.

Our Patent Leather Paste for restoring the gloss to all articles made of Patent and Enamel Kid Leather cannot be surpassed. It polishes quickly and easily; its lustre is brilliant, durable and waterproof, and is not a varnish, as it leaves no coating.

We guarantee it not to injure the leather, as it is free from acids.

It is invaluable for brightening the saddle and blinders of harness, as the polish is waterproof.

Just the thing for manufacturers of harness to use, as it will prevent the Patent Leather parts from becoming dull.

Price per gross, large size.....\$6.00
Price per gross, small size..... 3.50
Discount, 10 per cent.

Griffin Russet Traveler's Outfit.

An excellent thing to take along when traveling. Contains a bottle of cleaner for cleaning and removing stains. A box of our polishing paste and a polishing mitten.

Price per gross.....\$18.00
Discount, 10 per cent.

GRIFFIN SNOW WHITE.

For cleaning and re-whitening white shoes made of canvas, suede and buckskin.

Price, per gross, \$10.00.
Discount, 10 per cent.

GRIFFIN

High-Grade Shoe Polishes.

GRIFFIN M'F'G CO.,

Manufacturing Chemists,

82 Cortlandt St.,

New York, U. S. A.

Griffin Sterling Traveler's Outfit.

For Box-Calf, Vici Kid, French Enamel and all dry Black Leathers. Put up in a carton. Contains a bottle of Sterling Dressing, a box of Polishing Paste and polishing mitten. Also suitable for Enamel and Patent Leather.

Price per gross.....\$18.00
Discount, 10 per cent.

New British Envoy Presents Credentials.

THE new British Ambassador, Sir Mortimer Durand, presented his credentials to the President of the United States at Washington last month. The addresses on the part of each are given below, as they both bristle with sincerity. Said the Ambassador:

"Mr. President, I have the honor to inform you that King Edward VII, my august sovereign, has directed me to present to you in person this letter accrediting me as his ambassador to the United States of America. His Majesty has further directed me to assure you of his earnest desire that the friendly relations which exist between the United States and Great Britain may be maintained and strengthened, and I have received His Majesty's command to keep this object constantly in view.

"I am deeply conscious, Mr. President, of the responsibility laid upon me, and I am well aware how hard it will be for me to prove worthy of the high mission with which I have been honored. I come to America for the first time with a warm admiration for, but without any personal knowledge of, the great nation over which you have been called to preside, and I feel my inexperience the more keenly because I succeed as British Ambassador here one who had passed a considerable part of his life in this country, whose sympathies with your people were therefore based upon a thorough understanding and, I may add, whose singular charm of character endeared him to all who knew him.

"I can only say, Mr. President, that, with God's help, I will do my best to carry out the duty intrusted to me. No duty could be more in accord with my wishes, and it will be a very real happiness when my work here comes to an end if I can feel that I have been able to help, however little, in bringing about an increase of the good-will between our two nations. I believe that upon that good-will depends in no small degree the welfare of the world."

In replying the President said:

"Mr. Ambassador, it affords me sincere gratification to receive from your hands the letter whereby His Majesty King Edward VII accredits you as his ambassador to the United States of America. Through you, the personal representative of your sovereign, I cordially reciprocate His Majesty's desire that friendship and good-will between our two countries shall be strengthened and perpetuated, and with the concurrent efforts of the American Government I doubt not that success will attend your endeavors to fulfil His Majesty's desire to this beneficial end.

"Following as you do, Mr. Ambassador, in the steps of one whose genial sympathy with our people and whose intimate knowledge of this country stood him in good stead, enabling him to gain the confidence and esteem of this Government and to win the affection of all with whom he was brought into association, I cannot doubt that you, being inspired by the same good purposes and animated by the same kindly feelings, will achieve no less than did your lamented predecessor and merit equally with him the high regard of this Government and of my countrymen. It is fitting that this should be, and that, mindful of the ties of kinship and speech, moved by like aspirations of progress in the paths of peace and sharing a reverential trust in the Almighty that guides our destinies, our two nations and peoples through their ministering agencies should strive to reach a harmonious accord in all that affects their common interests."

Faster Mails Between America and Europe.

FOLLOWING the information giving in our last issue about expediting the ocean mails between America and Europe, comes an announcement of great interest to the ocean-going public and to those interested in the transmission of trans-Atlantic mails which was made last month by the management of the International Mercantile Marine Company.

This announcement, which is the outcome of an agreement between the company and the United States Post-Office authorities, says that with the new year Plymouth will be made the first port of call for east-bound steamships of the American line. English mails will be landed there, after which the vessels will cross to Cherbourg, where the Continental mails will be hurried ashore. As Plymouth is 150 miles nearer New York than Southampton, this new route will insure the landing of mails in London about five hours earlier, and it will also expedite the delivery of the Continental mails by about twelve hours.

"Beginning with the departure of the steamship Philadelphia on January 2d," the announcement says, "all east-bound vessels of the American line will stop at Plymouth, England, and Cherbourg, France. This will facilitate the handling of the English and the Continental mails. After delivering the mails at Plymouth and Cherbourg the steamers will proceed to Southampton. Heretofore passengers for Paris and other Continental points have disembarked at Southampton and crossed the Channel. The new arrangement will be a great convenience for those who wish to go to the Continent and return from there without crossing to England. It will also enable the Continental mails to reach Paris twelve hours earlier than formerly.

"On the west-bound voyages the steamers will leave Southampton at noon, as heretofore, calling at Cherbourg the same afternoon, and will not stop at Plymouth.

"Plymouth is approximately 2,950 miles from Sandy Hook and is 150 miles nearer than Southampton. By discharging the mails at Plymouth about five hours will be gained in reaching London. Ordinarily, the steamers will reach

Plymouth during Friday night and the mail will be in London early Saturday morning in time for distribution on the first delivery.

"The United States postal authorities, working in conjunction with the officers of the International Mercantile Marine Company, have lately made several changes intended to facilitate the transmission of the trans-Atlantic mail. The first of these changes went into effect on November 1st, including the equipment of the White Star steamers with sea post-offices and the change of the American line sailing time from this port from Wednesday to Saturday morning. As a result, the heavy Saturday mails have been transmitted to Great Britain on the American line steamers, which carry postal clerks, enabling letters to be assorted en route.

"In this way mails have been delivered for the London Post-Office in time for distribution on Saturday instead of the following Monday, as formerly, and a large part of the British mail has gained thirty-six hours in point of delivery. With this arrangement the American line officials believe that they have the most efficient and convenient service that can be devised both for mails and passengers."

Some idea of the tremendous extent of the commercial importance of this ocean mail business may be gained from the fact that last year the foreign branch of the New York Post-Office handled over 100,000,000 pieces of mail. This does not include the "closed mails" which pass through the office in transit from such cities as Chicago, St. Louis and San Francisco and from foreign countries like Mexico, Japan and Australia. Altogether from 5,000 to 7,000 bags of mail leave New York for Europe every week, and when one considers that each bag contains from 4,000 to 5,000 letters and from 200 to 400 papers it will be seen that the international exchange of ideas foots up an enormous total of business in the course of a year.

The German parcels post, which enables people to send packages at so much a pound, is being used more than it has ever been used before. In sending parcels to other countries than Germany, the sender has to pay regular postal rates on the matter. Thus far the Post-Office has handled about 1,600 parcels in the German parcels post at a minimum rate of 12 cents a parcel, and about 3,500 registered parcels, at a minimum rate of 20 cents.

The weekly mail race ending December 19th was won by the Cunard line steamship Campania, which sailed from New York December 12 at 1.13 P. M. and arrived at Queenstown on the 19th at 11.33 P. M. Her letters were distributed by the first delivery that morning, while the mails of the steamship St. Louis, which left New York December 12th at 11.10 A. M., or two hours and three minutes before the Campania, were only delivered at 1.30 in the afternoon. Merchants engaged in foreign trade are the chief beneficiaries of this acceleration of the mails.

Move for New Treaty with Britain.

AT the home in Washington, U. S. A., of John W. Foster, formerly United States Secretary of State, there was held last month a meeting convened in the interests of a permanent arbitration treaty with Great Britain. The meeting was attended by men distinguished in statesmanship, in literature, in law and in the naval and military service of the nation. Regarding this meeting the Brooklyn *Eagle* makes the following interesting comment: "The object is a good one and should obtain from public opinion that measure of enthusiastic encouragement which alone can insure its success. Since the fortunate settlement of the Alaskan boundary dispute we have no pending difference of opinion with Great Britain which can in any way affect the cordiality of the relations now existing between the two nations; but it would be rash to say that no such differences will arise in the future. The proximity on our north of a great British dependency and the maintenance by Great Britain of colonial interests in the West Indies, on the South American mainland and in Central America involve so many possibilities of friction that it were well to guard against the dangerous results of that friction while there is yet time. We cannot think of any cause which would be likely to drive our cousins and ourselves to an open rupture; but the existence of a treaty making incumbent the reference of disagreements to the tribunal at The Hague or to some temporary court would be a perpetual guarantee against the progress of disputes to the stage where national sentiment forgets reason in bitterness and where bitterness engenders hate. We trust that the meeting of the National Arbitration Committee, to be held in Washington on January 12, 1904, will give tangible form to a project that is now but in the chrysalis stage."

Making Cigars to Music.—A cigar manufacturer in Philadelphia, U. S. A., has hit upon a new idea. He has had a piano placed in each of the two large rooms in which the cigars are made. Every day a musician comes to the factory and gives the employees a singing lesson. This plan has been found to be not only pleasant, but profitable. The employer has discovered that the girls make more cigars during the hour of singing than they make during any other hour of the day.

Sugar-Cane Machinery.—Readers of THE AMERICAN EXPORTER who are interested in sugar manufacturing will be interested in a new catalogue describing machinery for that purpose which will be sent to them on application by letter to the George L. Squier Manufacturing Company, Buffalo, U. S. A. The catalogue is published in Spanish and Portuguese.

Without doubt, America's most famous Bottled Beer ^{is} manufactured from the purest and best materials known to the Brewing Art. Absolutely no beer in the world its equal in merit.

Established in 1836.

Owners and Manufacturers of

The Bohn Dry Air Syphon System insures a low and uniform temperature, ranging from 38 to 48 degrees Fahrenheit. With our Enamel Lining, you need only to wipe the food compartments with a damp cloth to clean perfectly. The only absolutely sanitary refrigerator made.

Adopted and used exclusively by the Pullman Company for all of their Dining and Buffet Cars. Pennsylvania Lines, New York Central, Michigan Southern, Union Pacific, Canadian Pacific and all other railways throughout "the States" and Canada as well as by thousands of homes, hotels and clubs.

For Foreign Markets Only.

The prices here quoted includes boxing ready for transportation and delivered F. O. B. cars at New York City.

No. 2. Style "A." Panel Door. Price, \$23.00. Outside measurements (inches): Width, 38; depth, 21; height, 44. Weight, boxed, 278 pounds.

NOTE.—Orders received direct, or through export commission houses. When ordering through the latter, to avoid errors, please mail us a duplicate of order.

Our forty-page catalogue, illustrating and describing the various styles of White Enamel Refrigerators made by us, mailed postpaid.

No. 2. Style "A," Panel Door.

No. 5. Style "D." Upper Door Glass.

From Milk to Butter in ONE Minute.
NO CREAM SEPARATOR NECESSARY.
The use of the "One-Minute Churn" assures to private families **fresh, pure and wholesome butter at all seasons of the year**, doing away with tainted and poorly manufactured butter.

EXPORT ONLY.—Upon receipt of **Thirty Dollars (\$30.00)** in U. S. Gold, or its equivalent, we will box, ready for shipment abroad, one of each, seven in all, of our "One-Minute Churns" as follows:

Size A.	Industrial Miniature, capacity 1 quart
Size No. 1 (Special Household Size) "	1 gallon
Size No. 2	3 "
Size No. 3	5 "
Size No. 4	7 "
Size No. 5	9 "
Size No. 6	13 "

NOTE.—Size A is an Industrial Toy for Children.
Orders received direct or through export commission houses.
Specify "One-Minute Churns."

American Trade with Egypt.

SOME months ago we printed extracts from the report of the United States Consul-General at Cairo regarding the possibilities of the hardware trade in Egypt for American manufacturers. The report went into the subject extensively, but only brief mention of it was made in THE AMERICAN EXPORTER, for it chiefly concerned the selling rather than the purchasing function of trade. W. T. Emmens, the correspondent of THE AMERICAN EXPORTER at Alexandria, Egypt, sends us the summary of the report, as reprinted in the *Egyptian Gazette*, and he makes some comments upon certain portions of it that are of interest to would-be purchasers of American goods in Egypt, as well as to the exporters of this country. Our correspondent sustains the contention of our Consul-General that the field is most promising for American manufacturers of hardware and other manufactures of iron and steel. Some extracts from the report with the comments of our correspondent are interesting, and no doubt Secretary Cortelyou, of the United States Department of Commerce and Labor, will take up the subject and add his influence to what those interested may do to remedy the troubles complained of.

According to the Consul-General the great difficulty in handling American goods in Egypt "is the time it takes to get consignments. It is unfortunate that goods cannot be held in stock in order to insure quick delivery. British and European firms send large stocks to their representatives in Alexandria and Cairo, and thus have the great advantage of giving prompt delivery."

As to this our correspondent at Alexandria gives names and specific instances, showing a delay of two months in the arrival of goods from the United States. Our correspondent writes:

"Some arrangement should be made and duly advertised with the Messageries Maritimes to take goods at New York for all the principal ports in the Mediterranean, India, China, Australia, etc., at fixed rates, to be carefully studied and expressly compiled for your export trade, accompanied by an authoritative estimate as to time of transit. This plan would probably involve transshipment at Marseilles, and this is a point which involves most careful packing—men being employed, if the goods are not to be damaged by rough handling. I believe my suggestion to be most valuable if your general export trade is to be developed as it may well be. At present goods are given over to the shipping agent, who naturally seeks the route by which he can most profit, irrespective of the fate of the goods. Another point is, that your manufacturers don't care to ship direct and despise small orders. To get orders through an American shipping firm is, of course, desirable, but it is short-sighted policy where competition exists. Experience proves that the rapid advance of the Italian and German imports is owing to the facilities they give in those countries for the execution of small direct orders from the manufacturers' agents in Egypt. I may add that I will receive any samples for exhibition or sale (if I deem it advisable), my charges being cut down to the lowest and remittance made immediately for all sales. Heavy machinery and metals are in the hands of large local firms who are well acquainted with American machinery, agricultural implements, etc."

In regard to the development of trade our correspondent, in commenting upon the report, declares that direct transportation facilities are the chief means of relief. He rather resents a comment about "bringing wide-awake American drummers (commercial travelers) to Egypt," for it is not a case where people are unwilling to buy, but rather a case of their inability to get what they know and want. It is quite probable that Secretary Cortelyou may be able, through the department of which he is the head, to suggest to the transportation companies such measures as may give them more freight to carry and American exporters more orders for their goods from Egypt. That country needs the goods we sell, its merchants want them, and all that stands in the way is proper and adequate transportation.

Features of Our Iron and Steel Exports.

THE recent announcement that a reduction of freight rates on iron and steel manufactures intended for exportation is being made by the railroads for the purpose of encouraging exports of American iron and steel manufactures lends interest to some figures compiled by the Department of Commerce and Labor regarding the commerce of the United States in iron and steel manufactures. These tables show that manufactures of iron and steel form the largest single item of our exports of manufactured articles, and have shown a more remarkable growth in exportation than perhaps any other great article in the large number which form the classification "manufactures." Beginning with \$52,144 in 1800, the growth was extremely slow during the first half of the century, being only \$1,953,702 in 1850. In 1860 the total was \$5,870,114; in 1870, \$13,483,163; in 1880, \$14,716,524; in 1890, \$25,542,208, and in 1900, \$121,913,548, the increase in the closing decade of the century being nearly four times as much as in the ninety years.

Considering the distribution of iron and steel to the various countries of the world, it may be said that Europe took in 1900 a larger total than any other of the grand divisions, the total value of iron and steel exports from the United States to Europe in that year being \$45,788,554.

Machinery forms by far the most important feature in the exports of iron and steel manufactures. The various classes of machinery which can be separately stated, such as locomotive engines, stationary engines, fire engines, electrical machinery, sewing machines, typewriters, shoe machinery, cash reg-

isters, laundry machinery, printing presses and pumping machinery, are shown in that manner. Aside from these, however, is a great group of machinery which is not stated in separate items, owing to its variety and the large number of different classes of machinery included. This single group of "machinery not separately classified" grew from \$10,000,000 in 1892 to over \$20,000,000 in 1902. The next largest item under the general classification of machinery is electrical machinery, which was only separately classified in 1898, amounting in that year to \$2,000,000, and in 1902 to nearly \$5,000,000.

Machinery alone formed in 1900 \$55,000,000 worth of the exports of iron and steel manufactures out of a grand total of \$121,913,548 of iron and steel manufactures exported in that year, or nearly one-half of the total. This statement of "machinery" does not include agricultural implements, bicycles, telegraph and telephone instruments, or other articles not exclusively or chiefly of iron and steel. Adding only these items of machinery included under iron and steel manufactures, it may be said that the exportations from the United States of machinery as a group amount to about \$75,000,000 annually.

Future of United States Department of Commerce.

GEORGE B. CORTELYOU, the head of the new United States Department of Commerce and Labor, issued his first annual report last month.

To people living in America it was one of the most interesting documents of the many that are presented to each new Congress. It covers a wide range of subjects and deals with diversified interests. Its whole tenor is of cooperation and helpfulness. Some of the subjects will be considered in subsequent issues of THE AMERICAN EXPORTER, but this concluding paragraph of Secretary Cortelyou's report is so characteristic of him and so true of the policy of the American Government that it cannot wait for presentation to our readers:

"The Department deals with the great concerns of commercial and industrial life. To be of service to these interests it must have their hearty cooperation and support. It must be a department of business. It must be progressive, but at the same time conservative. It must not deviate in its course from the pathway of justice, strict and impartial. It must be non-partisan in the highest and broadest sense. It must recognize no distinction, as between large and small interests, as between the affluent or powerful and the humblest citizen. If it attempts to occupy a field that properly belongs to private endeavor it will inevitably fail to realize the high hopes of its present well-wishers. It must adhere rigidly to the lines marked out since the foundation of the Government for federal agencies in executing the will of the people. If these general principles are made effective, if conservatism and impartiality, coupled with ever-increasing efficiency, mark its administration, I cannot but believe that this new Department will become a mighty influence for good in our commercial and industrial affairs."

Closer Trade Relations with Cuba.

RECIPROCITY with Cuba is now in force, the United States Congress having passed the bill putting it into effect last month. The treaty has been subject to considerable delay, but a great many interests were affected, and care had to be taken to do justice to all. The convention with Cuba provides that the products of Cuba shall be admitted into the United States at a reduction of 20 per cent. of the rates of duty now imposed, while United States products will be admitted to Cuba at a reduction of 25, 30 and 40 per cent., according to the articles, as enumerated in the treaty. Friends of the measure insist that this will give a much greater market to American products, and Treasury officials estimate that it will reduce the revenue of this Government by about \$7,000,000 a year. Whichever contention proves correct, the American nation has again fulfilled a pledge of aid and cooperation to a less fortunate neighbor.

Exports of Manufactured Articles.

OCTOBER is usually a dull month in the foreign trade, particularly in the exports of manufactures, but the official reports for that month last year were more than encouraging. The total exports of manufactures in October, as shown by the reports of the United States Department of Commerce and Labor, amount to \$37,558,675. This is a larger export than in any preceding October, except that of 1900, and even in that banner year of exports the total was less than \$100,000 above that of October, 1903. The increase over October, 1902, is about \$1,500,000; over October, 1901, \$3,000,000, and is more than double the total for October of 1893. Most of the principal articles of manufacture show a slight increase in October, 1903, compared with October, 1902. Agricultural implements show a gain of over \$40,000, compared with the same month of the preceding year.

Future Implement Exports.—The territory which our manufacturers have been supplying with implements and machines in the United States only represents a third or a fourth of the cultivated lands of the world. It is gratifying to note that our manufacturers are making good progress in building up their export trade, but enormous as our present exports may seem they represent only a drop in the bucket, as compared with the actual requirements of the farmers of foreign lands.—*Implement Age.*

Knock-Down Office and Home Furniture for Export. The "GUNN" K. D. Sectional Bookcases.

Top Section
List, \$3.00

9 1/4" Section
List, \$4.15

11 1/4" Section
List, \$4.50

13 1/4" Section
List, \$5.25

Base Section
List, \$2.65

THREE-SECTION CASE.

With top and base set up. Weighs 135 lbs. gross, 100 lbs. net, and of 6 1/4 cubic feet. This set represents the entire line of sizes, and will make a case for 10 books or 10,000 books, growing as the books accumulate. Measurements are inside. All sections 10 1/4 inches deep and 32 1/4 inches long. Made of selected quarter-sawn oak and handsome polish finish.

THREE-SECTION CASE, as shown, complete - - - each \$10.76
SIX-SECTION CASE, as shown, complete - - - each \$17.98

IMPORTANT NOTICE.—To secure full benefit of above, even sample orders should not be for less than the steamship minimum for issuing ocean bills of Lading. Some steamship companies accept not less than 40 cubic feet, while others not less than 80 cubic feet. Six Three-section Cases occupy 40 cubic feet; Four Six-section Cases occupy 40 cubic feet. NOTE explanation of ocean freight on "Gunn" K. D. Cases: "An ocean rate of 10 shillings per 40 cubic feet equals a cost of eight cents per section, or about four per cent. on the cost boxed f. o. b. New York."

Specify "Gunn" when ordering. Orders received direct or through export houses. When ordering through the latter, to avoid errors, please mail us duplicate of order. Our catalogue, illustrating and describing the various styles of Sectional Bookcases and Filing Cabinets made by us, mailed postpaid.

THE GUNN FURNITURE CO., Grand Rapids, U. S. A.

Western Union and A. B. C. Codes used.

Cable Address: "GUNN," Grand Rapids.

We also make a full line of Roll and Flat Top Office Desks and Typewriter Cabinets.

A FEW REASONS WHY THE "GUNN" K. D. SECTIONAL BOOKCASES ADMIT OF DIRECT IMPORTATION TO THE TRADE.

The assortment is SMALL. All parts are INTERCHANGEABLE, making every possible size bookcase from the same stock. They require but little space in warerooms, as the cases are shipped K. D. (flat) and can be set up as required, with no tools but the hands.

Our method of boxing K. D. (flat) insures arrival of goods in PERFECT CONDITION, as NO POSSIBLE DAMAGE CAN OCCUR TO FINISH AND NONE OF THE PARTS CAN SWELL OR WARP, as in ordinary furniture. Deliveries can be made in thirty days, and by using our special code, twenty days.

ADVANTAGES OF THE LINE.

The field to sell is very large, as the same stock meets the demand from offices and public buildings, as well as for home use—in fact, anywhere an article is desired to be covered from dust and moisture. Each sale made is a guarantee of repeated purchases for additional sections, as books accumulate. The sections can be added, vertically or horizontally, to fit the wall and space. The glass doors, when raised, disappear, sliding on small frictionless roller bearings. The "GUNN" is the only case in which a broken glass can be replaced by simply taking off the door, and without removing the books or taking the case apart. The cases, when set up, present a handsome appearance, with no objectionable features, and are as rigid as an ordinary bookcase.

We GUARANTEE the "GUNN" SECTIONAL BOOKCASES PERFECT IN ALL RESPECTS.

Special Offer for Export Only:

The prices here quoted (U. S. gold or its equivalent) include boxing for steamer, and delivered f. o. b. cars at New York City.

"Gunn" K. D. Sectional Bookcase.

This cut shows our knock-down (flat) construction. It is put together without nails or screws, or dowl-pins; the irons that are fastened to the shelves have upper and lower tongues that fit in the grooves in the bases, center sections and top sections, thereby binding all rigidly together.

BALTIMORE BADGE & NOVELTY COMPANY.

BALTIMORE, MD., U.S.A.

American Official on Russia's Intentions.

SO much has been printed in the papers throughout the world that a recent interview with Col. William R. Holloway, who was United States Consul-General at St. Petersburg for six and a half years, and who has been transferred to the post of Consul-General at Halifax, will be found timely and interesting.

"There is no country which is more misunderstood and misrepresented at the present day than Russia," said Colonel Holloway. "It is partly their own fault, and the censorship they exercise is partly responsible. Russia is a quiet country for its size, and an American is always *persona grata* there. Yes, they know all about us. Count Cassini keeps them well advised. You must remember that Russia comprises one-sixth of all the land on the globe, and that it is not half so settled as the United States. It will take a thousand years to settle it."

"Do you think that Russia is going to evacuate Manchuria?" Mr. Holloway was asked.

"I don't think that Russia ever intended to occupy it," he answered. "They're not going to retain possession of it. Why should they be at the expense of maintaining a government in China? But they're going to protect their railroad. Russia has been impoverished by her crop failures, and her treasury is depleted. There are failures due to the bad roads, which can be traveled only in summer when they are in good condition, or in winter when they are hard. In the spring and fall they are impassable, so that even if one province has good crops and plenty of food, it cannot be transported to the next. There are not enough railroads. They have borrowed lots of money from France, but they have never defaulted on the interest of their debts."

"I don't know anything about Corea. That's politics, and I don't talk politics. Nobody out there seems to think that there is going to be any war. They are always talking about Russia having soldiers on the Indian border and saying that she is going to take Sweden. Russia would like to have Turkey, but England won't let her."

Mr. Holloway then spoke of the German business invasion of Russia, and compared the Kaiser to President Roosevelt.

"The business of Russia is in the hands of the German-speaking people," he said. "German has been the business language ever since the Empress Catharine's time, and Germany has the trade of Russia. The secret of it is that Germany gives credit. The United States demands 90 per cent. payment on the receipt of the bill of lading, and that makes them pay for goods sometimes two months before they are received. That is the greatest disadvantage to American trade with Russia. Germany is wonderfully prosperous. The Emperor of Germany has as much energy as President Roosevelt. They are a great deal alike. No one can estimate the possibilities of the country. The land is very rich, and there is a belt in the Caucasus below Moscow which is called the black belt because of the blackness of the soil. The climate is very much like that of the United States. Odessa is like Tennessee. The trouble is that the uneducated peasants are not intelligent farmers. Only about one in eight is educated."

Germany Is Recognizing Worth of Our Tools.

REPORTS from all quarters of the civilized world show that the appreciation of American tools and farming implements is being shown to a greater degree month by month; in fact, there is a steady increase in the export demand that must be very gratifying to our manufacturers. One of the recent reports comes from Hugo Muench, the United States Consul at Plauen, Germany. He says: "American tools are forcing recognition from the more progressive mechanics of this country, but if a cheap imitation can be had it is generally chosen. American farming implements—the best in the world—are but rarely encountered in these parts, and when found are usually discovered to be of an old, obsolete pattern. Only when the inexorable law of concentration shall have forced an abandonment of the present system of cultivating small holdings will the advantage of American labor-saving implements become so obvious as to displace the antiquated and cumbersome tools of former centuries. Viewing the general condition of our trade with this country, it is apparent that there is no valid reason to anticipate an early decline in its present vitality. The quality of American goods, despite occasional unfriendly criticism by the press, wins new markets year after year, and to the United States the Old World must continue to look mainly for its supply of the great staple products."

Russia at the American World's Fair.—According to advices received in this country Russia will have the most extensive exhibit at the coming American World's Fair which that country has ever made at a foreign exposition. The exhibit space will cover more than 750,000 square feet, which will be occupied by more than 2,500 individual exhibitors. Russia's national pavilion will be constructed on native soil and taken to the exhibition in sections and there erected by Russian carpenters.

Disc Wheels and Ventilators.—W. H. Carrier, M. E., has prepared an interesting pamphlet on "Heating and Ventilation of Factory Buildings," for the Buffalo Forge Company, Buffalo, N. Y., U. S. A. The company has also issued a neat catalogue on the subject of disc wheels. The readers of THE AMERICAN EXPORTER will be supplied with copies on making known their wants to the company.

Largest Printing Establishment in the World.

THE first year the United States Government occupied a building distinctively set apart for the conduct of its printing business the operating expenses amounted to something over \$500,000, writes J. Whelpley in *The Review of Reviews*. The cost of the public printing grew, therefore, in over sixty years, from about ten thousand to over a half a million a year, and has grown in the last forty years from the half-million mark to ten times that sum. Some idea of the growth of this institution is shown by the fact that when the first Government printing-office was established 60,000 square feet of floor space was sufficient, whereas at present 377,200 square feet is none too much to give all branches of the work ample quarters. The employees now number nearly 4,000, about one-third of whom are women. The entire establishment is conducted upon an enormous scale. As to the size and extent of the plant, the number of people employed and the material consumed, there is no printing-office in the world which approaches it in any of these particulars.

Germany and France are among the large countries which do their own printing. England does hers by contract. Some of Britain's colonies, however, do their own printing, Canada especially having a printing plant of considerable size and modern efficiency. New South Wales is another colony which also maintains a government printing-office. As stated, however, no public or private institution anywhere in the world approaches in size or facilities the one in Washington.

Here there are always a million and a half pounds of type in stock, and yet this is not considered sufficient, for at least 250 tons are tied up in live standing matter on the galleys. The payroll of the establishment approaches \$3,500,000. The proof paper alone consumed in the composing-room costs \$2,500 a year. Over 40,000 pounds of printing ink are used in twelve months, and ten tons of roller composition are necessary to keep the presses in good order.

The paper bill, of course, is the largest supply item, and amounts to over \$800,000 a year, which means a daily average of about fifteen tons of paper and cardboard. These figures, however, will convey but a vague impression to the mind of the layman. Only a practical printer can understand the amount of work which must be done to consume this enormous aggregate of material. It may be said, however, that during the past year 1,648,214 bound volumes figured as a formidable part of the output.

Standard Unit of Refrigeration.

PEOPLE almost everywhere on the face of the globe are now interested in refrigeration. Of course, comparatively few care about how it is measured. On a torrid day in tropical countries the question of measurement is subordinate to the consideration of securing all the coolness that can possibly be obtained. For measuring heat there has long been a standard, but in artificial refrigeration it seems to have been overlooked. At the recent annual meeting of the American Society of Mechanical Engineers considerable time was devoted to the subject. J. C. Bertsch, of Atlanta, U. S. A., read a paper, in which he gave his views as an expert in refrigeration. He called attention first to the extensive employment of mechanical refrigeration, and especially to the rapid increase in its use in the last few years. The writer said that sooner or later it will be applied to our dwellings and public halls, not only to replace the ice in the refrigerators, but to furnish also cooler and better air in the hot season of the year. There are thousands of refrigerating machines in use, and yet no standard unit of refrigeration has been established. The work accomplished in melting 2,000 pounds of ice at 32 degrees Fahr. in water at the same temperature has been fixed at 284,000 British thermal units, and that is all, and even this cannot be properly applied. Two tons of ice melting are roughly considered to equal one tone of ice-making, although the former requires 568,000 British thermal units to 420,000 for the latter. The Southern Ice Exchange, U. S. A., and the Ice Machine Builders' Association having appointed a committee for standardizing the proportions of the machinery and apparatus employed in refrigeration and to assist in establishing uniform regulations, the matter was brought before the society by Mr. Bertsch to invite cooperation. The conditions of mechanical refrigeration and the mode of computing the efficiencies were discussed in the paper, which concluded with a suggestion that a committee may be appointed, consisting of members of the society actually engaged in refrigerating engineering, to cooperate with the other bodies interested for the sole purpose of establishing a standard unit of refrigeration. The committee was appointed.

"International Exchange."—This is the title of a new book of value to persons engaged in international trade. It is a practical work on the terms, parts, operations and scope of international exchange, describing the methods of the foreign banking department and its administration by American bankers. The author is Anthony W. Margraff, manager of the National Bank of the Republic of the City of Chicago, U. S. A. Mr. Margraff has had an experience of quarter of a century in this field, and he goes into the subject thoroughly, giving in the volume of nearly 300 pages a mass of information, much of which has not hitherto been published, and which, in its entirety, makes it valuable for constant consultation by bankers and others engaged in transactions between foreign countries and the United States. Mr. Margraff's address is 1138 National Life Building, Chicago, U. S. A.

BALKE MANUFACTURING CO.,

Patentees and Manufacturers of

**Balke Combination Davenport, Billiard and Pool Tables,
and Standard Tables.**

INCORPORATED \$100,000.

Style "A," as a Davenport.

Benedict Special Billiard Table.

No home or club is thoroughly equipped unless it contains either a Davenport or Standard Billiard or Pool Table or Combination Billiard and Pool Table. We make both, of the highest grade and of the highest quality.

Note—The prices here quoted, U. S. Gold or its equivalent, are for **Foreign Markets Only**, and include boxing ready for steamer, delivered f. o. b. cars at New York City.

Style "A," as a Davenport, is made of quartered sawed oak covered with N. Y. leather, and, as shown, is a handsome adjunct to a parlor or clubroom.

Style "A," converted into a Billiard or Pool Table, has a playing surface of $3\frac{1}{2} \times 7$ feet; has 6 polished maple cues, and 4 genuine ivory billiard balls for billiard table and 16 best quality composition balls for pool table. Price complete, **\$95.00**. Gross weight, 800 pounds; net weight, 650 pounds. Size of boxes: $4' \times 8' \times 6'$; $32'' \times 36'' \times 6'$.

Standard Billiard Tables.

"Benedict" Special is the best table for the price ever offered. The bed is of Vermont slate; imported billiard cloth; cushions are made of the best rubber. Furnished with 12 polished cues and 4 genuine ivory billiard balls. Size of playing surface is 4×8 feet. Price complete, **\$100.00**. Gross weight, 1,240 pounds; net weight 920 pounds. Size of boxes: $4'2'' \times 8'2'' \times 8'$; $4' \times 8'2'' \times 2'$.

"Den" Special is just the table for the den; made of oak, while the bed is of Vermont slate; furnished with 6 polished cues and 4 genuine ivory billiard balls. Size of playing surface, $3\frac{1}{2} \times 7$ feet. Price complete, **\$90.00**. Gross weight, 700 pounds; net weight, 500 pounds. Size of boxes: $4' \times 8' \times 8'$; $3'6'' \times 6' \times 2'$.

Orders received direct or through export houses. When ordering through the latter, to avoid errors, please mail us a duplicate of your order. Our catalogue, illustrating and describing the various styles of Billiard and Pool Tables manufactured by us, mailed postpaid.

Style "A," converted into a Billiard Table.

"Den" Special Billiard Table.

BALKE MANUFACTURING CO., Grand Rapids, Mich., U. S. A.

CONTINENTAL CAR AND EQUIPMENT CO.

FOREIGN DEPARTMENT:

Whitehall Building, Battery Park, New York, U. S. A.

Cable Address: "CONEQUICO," New York.

MANUFACTURERS OF

Railway Freight, Plantation, Industrial and Mining Cars.

ALL-STEEL FLAT CAR.

CUBAN CANE CAR.

GONDOLA CAR.

PUER RICAN CANE CAR.

We also make Special Cars for all purposes, from designs furnished, or will furnish our own designs upon request.

FOR FOREIGN MARKETS.—Our Cars are taken apart and packed for shipment according to the best known methods.

Our Catalogue (English and Spanish), illustrating and describing the various styles of STANDARD CARS made by us, mailed postpaid.

Please mention THE AMERICAN EXPORTER.

"A TWENTIETH-CENTURY MARVEL IN WASHING MACHINES."

THE Guarantee

FOUR-STROKE ROTARY

Washing Machine

GUARANTEE WASHER.

GUARANTEE WASHER.

Just placed upon the foreign and home markets, combines the **Latest Improvements in High-Speed, Ball-Bearing Washing Machines** and will accomplish all that is claimed for or required of any washing machine, and more.

NOT A SPECULATION BUT AN INVESTMENT, the returns of which will pay you ONE HUNDRED (100) PER CENT.

FOR TWENTY DOLLARS in U. S. Gold, or its equivalent, we will crate, ready for steamer and deliver f. o. b. cars at New York City, **Four (4) Guarantee Four-Stroke Rotary Washing Machines**. (Retail in the United States of America at ten dollars each.) Weight, three hundred pounds Order **FOUR NOW**. Later you will order in large quantities.

MICHIGAN WASHING MACHINE CO., Mfrs., Muskegon, Mich., U. S. A.

Also makers of the world-known "Muskegon" and "Michigan" Washing Machines, over 250,000 of which are in use throughout the United States.

NOTE.—When ordering through export houses, to prevent mistakes, please mail us a duplicate of your orders.

The WATROUS SANITARY SPECIALTIES

The Watrous Combination Bath Fixture.

This fixture supplies hot or cold water or any desired mixture, by simply turning the handle to the right or left. To empty bathtub, simply lift the handle.

It is the only perfectly sanitary bath fixture made, as the tube is always filled with clean water direct from the supply instead of from the tub, and therefore impossible to become foul.

Has an independent supply passage direct to tub. **Can be attached to any bathtub.** Is constructed with ordinary Fuller balls. Is simple, cheap, durable and heavily nickel plated.

Upon receipt of price we will box, ready for steamer, and deliver F. O. B. cars New York, as follows:
One (1) Watrous Aquameter Water Closet, complete (Fig. "A 4.") as shown. Six (6) cubic feet. Weight, 100 pounds..... **\$30.00**
One (1) Combination Hot and Cold Water Bath Fixture, as shown. $\frac{3}{4}$ cubic feet. Weight, 17 pounds..... **\$15.00**

Our sanitary specialties are protected by U. S. and foreign patents. Our illustrated booklet mailed, postpaid, to any part of the world. Please mail us duplicate order when ordering through commission houses.

The Watrous Aquameter Water Closets.

Adopted by **The Pullman Company** and **all important Railway and Steamship Companies** in the United States.

These closets have no equal for **Public Buildings, Residences, Steamships, Private and Parlor Cars.**

The closet shown operates perfectly with $\frac{1}{4}$ -inch or $\frac{3}{4}$ -inch pipe, according to pressure.

Connected direct to service pipe, without any tank. Uses from one to three gallons of water to each flush. Saves 50 per cent. in water bills. Noiseless and positive in action. Neat and durable. Successful everywhere. Fully guaranteed. Thousands in use everywhere.

Water Closet.

Watrous Combination Hot and Cold Water Fixture.

THE WATROUS COMPANY, Manufacturers, CHICAGO, U. S. A.

Deriving Electric Power from Fuel.

AMERICAN inventive genius has at last bridged over a gulf that has been worrying electricians for many years, if the tests made last month in Newark, N. J., are to be accepted as conclusive. The inventor has experimented for years in an effort to generate electricity direct from fuel, and has constructed an apparatus which seems to have solved the perplexing problem. The inventor calls his machine a dynelectron.

The process of generating electricity consists of maintaining a fused electrolyte in an iron containing vessel or cell at approximately 390 degrees Fahrenheit and forcing through porous electrodes certain gases at a proper pressure and in proper proportions. When combined in the heated electrodes the slow oxidation of the gases gives off an electric current of great force.

Early in the experimental work the inventor built a 60-horse-power machine which performed all of the duties expected of it, but failed in one most essential particular. The porous electrodes disintegrated rapidly in the process of generation, and the inventor realized that in order to perfect the machine so that it would have a commercial value it would be necessary to devise an indestructible electrode. In this work alone he spent nearly two years before he found the secret.

If the inventor's hopes are realized he will succeed in eliminating the boiler steam engine and dynamo in the production of electricity. He says his generator will be the direct means of a vast saving in the production of light, heat and power. Speaking of his machine and the experimental tests the inventor says:

"The direct utilization of any fuel and the conservation of what has been waste energy is by this apparatus believed to be made certain. It is not an invention in the ordinary acceptance of that term, nor is it the result of accident or of having stumbled upon a hidden fact, but it is the solution of a problem carefully and patiently worked out along strictly scientific lines. To the manufacturing industries of the world it means a marvelous cheapening of the cost of operation and of production.

"The dynelectron illustrates an achievement in electro-chemistry. It is remarkable for its simplicity of design and construction, its durability and the economies it is intended to effect. While the size of the one exhibited is but a small unit of power, its work is such as to show that an electric current is generated. Tests made in every possible way have met every requirement from the viewpoint of the electrical expert. They have demonstrated an efficiency from which deductions made show that, as compared with the means now used to produce electric power and light, the present cost can be reduced three-fourths.

"The dynelectron may be described as an automatic plant consisting of a gas retort and cell, in which the electricity is generated and passes out through the transmitting wires. The expense of installing a commercial plant, it has been determined, will be about one-fourth of the first cost of the present plants of boiler, engine and dynamo. Still another important feature is that while several conversions are necessary with the methods now in use to produce electrical energy, only one is required with the dynelectron.

"The average efficiency of producing electricity with steam is 8½ per cent., as against 45 per cent. with the Reid process. Any fuel can be used—wood, gas, coal or oil. The cheaper the fuel the cheaper the cost of production with the dynelectron. Experts have conceded that the dynelectron gives out an electric current of high efficiency, that it can be transmitted to motors with constant and equal pressure, and can be utilized for any purpose for which electricity is intended or desired, whether it be for motive power, as an illuminant, or for heat."

Electric Motors Versus Steam Locomotives.

A WRITER in the New York *Herald* contributes an interesting chapter to contemporaneous literature upon the subject of electric traction replacing the monster steam locomotives of the present day. In several previous issues THE AMERICAN EXPORTER has informed its readers regarding the progress which is being made in this direction. The *Herald* writer repeats some things that we have said, but these extracts are interesting as showing the progressive condition of the country as we begin the new year:

"The steam locomotive is doomed! Throughout the length and breadth of the land the great steel network of rails will soon accommodate instead a newer, better and safer type of prime mover than the dangerous, high pressure, reciprocating monster with which we are all familiar. The electric locomotive will be the usurper of the time-honored and faithful steam engine, for it has been proved by exhaustive tests that the former mode of propulsion is in every way the more desirable, although the latter has admittedly served mankind well these fifty years. This gigantic revolution from steam to electricity on railroads will not take place in a day or a year or a decade, but those of our own generation may expect to live to see this remarkable transformation which is approaching so gradually, silently and systematically. They may further expect to journey from New York to Chicago (900 miles) drawn by a 150-ton electric unit in less time than is now consumed by the Twentieth-Century Limited, one of the fastest trains in America.

"The conversion of steam railroad systems to those employing electric traction had its first subtle beginnings when the mule-drawn street cars gave way to the trolley, and the rapid and economical features of the electric street railway over animal and other motive powers soon indicated that electricity was destined to become a mighty factor in future transportation.

"With improvements in electric generators, transmission lines and motors and the rapidity of their acceleration came the first important step in electric railroading when the little steam dummies were exchanged for electrically propelled cars on elevated railways. In this system the third rail is employed, and there are in different parts of the country electric surface railroads using the third rail for limited distances. With all these advances there is still a considerable gap to be bridged before the absolute adoption of electricity for long-distance traction is made, but just now another link has been added to the chain of progress, for the New York Central Railroad has placed a contract with the General Electric Company to equip its suburban lines out of New York City.

"To determine the power required to propel the trains an ingenious method was brought to bear, for the number, weights and numerous other variable elements would not lend themselves conveniently to solution by mathematical formulae, and so recourse was had to a dynamometer car, by means of which the drawbar pull of a train could be measured, and by testing a large number of trains of various weights, and finding the average power required for each train, the mean load of the total number of trains could easily be deduced.

"The dynamometer car is owned by the Illinois Central Railroad Company, together with the University of Illinois; it was coupled between the engine and the train in each test, and four runs for each type of train were made. The purpose of the dynamometer car, as has been indicated, is to measure the drawbar pull, and therefore the power required. The record thus obtained illustrates graphically the power required of and delivered by the modern steam engine and what the electric locomotive would have to compete with in order to hold its own. There are other questions involved in train operation of great importance when this change from steam to electricity is under consideration; one that may be referred to briefly is that of braking—that is, stopping a train—which is second only to that of acceleration or starting a train, for the drawbar pull during retardation is often as great as it is in acceleration. The braking effort of a train on its locomotive sometimes reaches as high as 11,000 pounds.

"Mr. Arnold, in summing up the weights of all the steam locomotives now in service on the New York Central Railroad, found that these could be supplanted by electric locomotives having a total weight of sixty-five tons each, if properly constructed. By a careful analysis of the choice of systems, discussion of plans and estimates, cost of installation, operating expenses and fixed charges per annum and many other details, Mr. Arnold ascertained the relative cost of steam and electricity."

The figures showed that there is only a slight saving in operating expenses in favor of electric traction, but its economical operation, its cleanliness and safety were sufficient to warrant its adoption, even if it were more expensive than steam. One of the advantages of electric traction, economically considered, is that the locomotives are made up of a number of units exactly fitting the requirements of the train to be hauled. In the steam system now employed an engine weighing 100 tons may be pressed into service, when one of 50 tons would suffice to propel the train.

Largest Pump-Making Plant in the World.

A PUMP manufacturing plant which will be the largest in the United States, and probably in the world, is now under construction at Harrison, N. J. The new plant at Harrison will accommodate from 4,000 to 5,000 men and will cost in the neighborhood of \$2,000,000. It consists of a main machine shop over 1,000 feet long, an erecting shop 592 feet long, an erecting shop 210 feet in length and four galleries in height. The main foundry is 600 feet in length and the special foundry for small work 410 feet in length, with a building 200 by 60 feet in size for cleaning castings. The pattern building is four stories high and 550 feet long and is divided by fire walls into four sections. Electric power distribution is to be employed throughout, and the grounds will be illuminated by electric lights. The buildings will be connected by a complete system of railroad tracks entering the ends of the building and placing the works in direct communication with two railroad systems.

Advance in American Carriage Industry.—Foreign-built carriages, once so numerous in the most select circles of some Eastern American cities, are now rarely seen. The *Carriage Monthly* says American carriages are fully superior to the best made on the other side of the water. This applies to character and style of design, as well as to workmanship. While this may appear like an American boast, the correctness of the statement is vouched for by impartial British builders themselves, who are thoroughly familiar with American carriage-shop productions.

American Butter-Making Machinery.—United States Commercial Agent Felix S. S. Johnson, at Stanbridge, Canada, says: "Quebec and Ontario are the best butter-producing provinces in the Dominion of Canada. One can hardly travel in any direction without seeing a creamery or cheese factory. I find that separators from the United States can compete with those of Canadian make. The Canadians, as a rule, are anxious to try our machinery, which is superior to their own, as well as cheaper in price."

Filing Cabinets for Memos., Clippings and Mss.

Home Filing Cabinet No. 60.

These Cabinets are especially designed for **Lawyers, Doctors, Ministers, Lecturers, Novelists**, and for all classes of **Literary People** who desire to keep a tabulated account of articles of interest to them.

UPRIGHT FILING CABINET No. 320 (our most popular Cabinet) contains 300 open index files, with card index for each subject; is 5 feet high, 26 inches wide and 12 inches deep. Weighs—boxed, ready for steamer—130 pounds; 10 5-6 cubic feet. **Price, \$21.25.**

HOME FILING CABINET contains 60 one-half-inch files, with card index for each subject; measures 14 inches high, 24 inches wide and 12 inches deep. Weighs—boxed, ready for steamer—45 pounds; 2½ cubic feet. **Price, \$6.75.**

NOTE.—The prices here quoted are f. o. b. cars, New York.

Upright Filing Cabinet No. 320.

We also make Filing Devices in Sectional and Solid Cabinets.

THE LIBRARY FILING CABINET CO.,

100 WASHINGTON ST., CHICAGO, U. S. A.

Effects of the American Cotton Corner.

THE United States, in sentiment and in legislation, is growing more and more opposed to so-called "corners" in any sort of commodities. In our September issue we gave an account of the cornering of the American cotton market by a single man and described how millions of people were affected by his operations. The effects have by no means died away, and the mills in various parts of the world that have depended on American cotton at a reasonable price for their profitable existence have not yet recovered from the semi-panic into which they were thrown. It is fortunate that such speculators are rare, and that their opportunities are very few. The cotton crisis is a matter of international importance and the prevention of a repetition of it is of equal interest, so that the following excerpts from a report sent from London by United States Consul-General Evans are pertinent at this time:

"The minds of all who, looking beyond the present distress, are face to face with the fact that the future will see an annual recurrence of the depression are centered upon the topic of Empire-grown cotton. It is admittedly the only hope for the future, and it is satisfactory to be able to record progress in the enterprise. Sir Alfred Jones, who is president of the British Cotton Growing Association, has stated that the movement gives much promise in West Africa. Three hundred tons of cotton have already arrived from Lagos and large quantities are accumulating for shipment.

"It is expected that shortly something like 30,000 acres will be under cotton cultivation on the West African coast. Many tons of cottonseed have been distributed and now an extensive area is under cultivation. There are many thousands of acres in the vicinity of the newly constructed railway which are available for cotton growing, and this land will at no distant date be fields of growing cotton.

"During the American Civil War and also at the time of the notable cotton famine Lagos produced large quantities of cotton, and there are many parts of the colony where the residue of this cotton is growing wild and even so is described as of fine quality. In years to come Africa will be able to grow all the cotton which the English manufacturers require and still have a surplus for exportation."

Daniel J. Sully, the man who engineered the American cotton corner, has written an article on the subject, from which the following extracts will be found of interest as showing the importance of the staple in the world's markets:

"The present serious condition in the cotton markets of the world and the danger threatening the textile industry of the United States, of England, France, Germany, Russia, Switzerland and Spain can be traced to only one cause—the sterilization or impoverishment of the cotton seed. Serious as is the situation to-day, and high as prices are, the situation will be more serious and the prices higher and higher each year until measures are taken by which proper seed can be planted for the growth of the cotton crop.

"Paradoxical as it may seem, the curtailment of the cotton crop is a natural result of the growth of the cotton-seed industry. A quarter of a century ago the cotton seed was the bane of the cotton planter. He had great difficulty in getting rid of his surplus seed. It was burned, cast into the rivers, used to fill gullies and hollows and hauled away at no little expense. But since the discovery of the uses of cotton-seed oil, cotton-seed hulls and cotton-seed meal the demand for the seed has grown to great proportions. The southern portion of the United States is dotted with cotton-seed oil mills, and what was once regarded as refuse now brings nearly \$100,000,000 a year to that section of the country.

"This would be a magnificent asset were it not for the fact that the oil mills demand the heaviest and richest of the seed, leaving only the poorest for the planter to put back in the ground for the planting of his next crop. The fierceness of competition is such and the prices paid for seed are so large that within the last five or six years the planters have impoverished their seed supply to the utmost limit. Poor seed brings a poor cotton yield. Increased acreage is no remedy, even if it were possible under present conditions to extend the acreage much beyond its present limits. Thoughtful men see no prospect of a change in the immediate future. Surely none can be expected as long as the spinners have to scramble for cotton to keep their mills going and the cotton-seed mills pay top-notch prices for their supplies."

Mr. Sully quotes statistics to prove his contention, for which we have not the space. He continues: "Cotton is the most valuable money crop of the world to-day. It is used in more of the world's staples than any other of the earth's products. Its uses are constantly widening, and yet we are face to face with the condition of a constantly shortening crop. It is idle to charge the big advance in prices to manipulation of the market, to weather conditions in the cotton belt, to lack of moisture, lateness of planting or to any other of the stock causes. Every student of the cotton world who gives serious consideration to the subject will come back to the basic trouble of the impoverishment of the seed. This subject is of far greater importance than the average man realizes.

"You cannot look for any change in the United States until the danger from the impoverishment of the cotton seed is brought home to the planter. At present he is blind to this menace. The present crop will bring to him at least \$150,000,000 more than any other crop he ever raised. That would seem to prove that he is favored by fortune. The crop of next year perhaps will

bring even much greater returns. But there is an end to all things, and sooner or later it will be realized that what is now a godsend may bring about disaster.

"The world must have cotton. If it cannot get enough from America it will get it elsewhere. It is true all efforts to find cotton land equal to that of America have failed, some by reason of transportation difficulties and some from other causes, climatic and otherwise. Man is ingenious and persevering, however, and should a cotton famine extend over a period of ten or more years we will find a rival of the United States developing in some other land.

"In the interim America's manufacturing is growing, and it is confidently expected that before other countries can be made to produce cotton American mills will require practically all the raw material this country can produce under present methods. To-day the American cotton makes up nearly 85 per cent. of the cotton that is grown. Egypt grows a long staple cotton that is used in the finest of goods. India grows a short staple cotton that is used in the coarsest of goods. America grows the staple crop that is the medium between the Indian and the Egyptian, and is the great commercial necessity of the textile world. There is a distinct relationship between the American and the other crops, each having a bearing upon the other, and the Egyptian and the Indian planter shares relatively in whatever condition affects each distinct growth."

Decision in Venezuela Matter on February 1st.

HERBERT W. BOWEN, United States Minister to Venezuela, returned last month from The Hague Tribunal, where he appeared as the representative of the United States and Venezuela. "In all twelve countries were represented before The Hague Tribunal," said Mr. Bowen. "The question submitted to the tribunal was whether Great Britain, Germany and Italy are entitled, by reason of the war which they instituted against Venezuela, to have their claims against that country paid before other creditors are paid. The decision on that question, which will be forthcoming on February 1st, when the Tribunal meets to announce its decision, will be of great importance, inasmuch as it will establish a precedent that will indicate what methods creditor nations should pursue in the future in collecting claims."

Mr. Bowen said that in the course of the session the court heard every "possible and impossible" argument in favor of war and warlike methods for collecting national debts, and they also heard every enlightened and humane reason why creditors adopting peaceable methods should not be held to have forfeited their right to equality of treatment to bellicose creditors.

"If we were a little further advanced in civilization," said Mr. Bowen, "arbitrators would no doubt have been asked by all to decide that preferential treatment be given to nations that refrained from resorting to war and endeavored to collect their claims by diplomacy. But arbitration is comparatively a new institution, and until the Venezuelan case arose the nations did not regard The Hague Tribunal with great favor. It was even thought that some of the strongest nations were opposed to recognizing the Tribunal at all. However that may be, the most ardent supporters of arbitration are now quite unanimous in asserting that this Venezuelan case, in which no fewer than twelve nations are interested, has given The Hague Tribunal the recognition and respect it needed as the supreme international court of justice and peace."

Turbine Tests for United States Navy.

THE United States Congress will have the turbine engine question to deal with among many other interesting matters that will come up during the present session. Sentiment among the members of both the Senate and House Naval Affairs committees is believed to be favorable to an appropriation of \$25,000 for experiments by the Navy Department with steam turbine engines. This appropriation has been asked for by Rear-Admiral C. W. Rae, chief of the Bureau of Steam Engineering, who believes that at least two small ships of the navy should be fitted with this type of propulsive machinery for experimental purposes. Rear-Admiral Melville, retired, who was Rear-Admiral Rae's predecessor, made a recommendation to this effect.

A board, of which Commander John R. Edwards and Alfred B. Canaga were members several weeks ago, rendered to Rear-Admiral Rae a report of an inspection they made of the turbine yacht *Revolution*, equipped with the Curtis type of turbine. They found this yacht very fast, especially for short distances. They made careful observation of her general features and of the engine installation. While the performance of the craft was creditable for her class, they reported that there was no means of telling how expensive her engine might be in steam consumption or how effective it might be, because there was no way of measuring these features in a turbine, as there is in a reciprocating engine.

The Board favors the installation of steam turbine machinery in some type of naval vessel. The Bureau of Steam Engineering and the Bureau of Construction and Repair are and have been for several months conferring as to the best methods of installation of machinery and the best type of hull for a turbine propelled scout ship or cruiser, should one be authorized.

Four Hundred Varieties of Apples.—The United States Agricultural Department has growing in its nursery at the Arlington farm no fewer than 400 varieties of apples. One of the studies of the department is that of growing fresh fruit with a view to its artificial storage.

Cary's Universal Box Strapping.

Made of Soft Steel through which nails can be easily driven.

Put up in coils of 300 feet each and packed 20 coils in a case.

Made in four widths, viz.:

$\frac{1}{2}$, $\frac{5}{8}$, $\frac{3}{4}$ and 1 inch.

Patented in all countries.

Packed very securely for export.

CARY MFG. CO. 19 & 21 Roosevelt St., New York.

Cable Address: "CARLEIO."

Codes used: A B C, 4th Ed.; A B C, 5th Ed.; Western Union.

Before Using
SMOOTH-ON Castings.

After Using
SMOOTH-ON Castings.

In ordinary foundry practice many iron castings are rejected which could as well be saved. Their strength is not affected by blemishes; the only reason for dumping them on the scrap heap is their appearance.

SMOOTH-ON is not a mere filling. It is a dry, metallic composition, which, upon being mixed with water, becomes a hard metallic iron that is insoluble in water, petroleum or other oils; that will stand an intense heat; and the expansion and contraction being the same as iron is why it is sometimes called Magic iron. When applied to a blemish in a casting by a skilled mechanic, the blemish is removed.

Write for our 60-page Illustrated Book, telling about the different Smooth-On Cements and their uses. Sent free.

SMOOTH-ON MFG. CO.

572-574 Communipaw Ave., Jersey City, N. J., U. S. A.

Fort Madison, Iowa, U. S. A.

CHALLENGE REFRIGERATOR CO.

Our plant, occupying twenty [20] acres of ground, is without question the largest and most complete in every detail of any similar works in the world.

Over 400,000 Challenge Refrigerators
sold and in use throughout the United States of America.

Our catalogue, illustrating and describing the various styles of Refrigerators made by us, mailed postpaid to any part of the world. Prices quoted f. o. b. cars at New York City. Orders received through export commission houses.

Challenge Refrigerator Co.

MANUFACTURERS,

Grand Haven, Mich., U. S. A.

Single-Door Refrigerator.
23 in. long, 15 in. deep, 37 in. high; weight, when packed for export, 90 lbs.; measurement, $9\frac{1}{2}$ cubic feet. Price, f. o. b. New York, \$4.50.

The Handy Fruit and Vegetable Slicer

The most interesting kitchen utensil ever invented. It slices every kind of fruit or vegetable into an infinite variety of unique and fancy designs, making an entirely new, novel and delicious product.

Is invaluable for making delicate salads, garnishings, etc. Makes Juliennes ten times as fast as by the ordinary method and is the only utensil that will produce Lattice Potatoes. Is extremely simple to operate and sells rapidly wherever shown.

\$16.50 Upon receipt of SIXTEEN and 50-100 DOLLARS in U. S. Gold or its equivalent, we will deliver boxed, ready for steamer, F. O. B. cars New York, one gross [144] No. 6 X SLICERS, for Export only. Weight boxed, 120 lbs.

NOTE.—To facilitate our rapidly increasing export trade we desire to arrange with one responsible business house in each trade center of the world, to handle our NO. 6 X SLICERS and other specialties manufactured by us.

HANDY THINGS CO.,

Manufacturers,

LUDINGTON, 40 to 50 Rowe Street, MICHIGAN, U. S. A.

Growing Practicability of Automobile Boats.

AUTOMOBILE launches seem to be the coming fad. Most people call them autoboots, and a writer in the Brooklyn *Eagle* gives some interesting information about them. Why they are called autoboots no one knows or cares, but that is the familiar term authorized by common usage. Small boats, ranging all the way from 20 to 100 feet in length, equipped with light yet powerful motors, drive these pleasure craft up and down the Hudson River, along the Sound, and elsewhere near New York City, among the Thousand Islands of the St. Lawrence River, bordering between the United States and Canada, at speeds varying from 14 to 30 miles an hour. And the best of it is, that no matter how high a speed is reached, there is no intrusive deputy to make arrests and no judge to impose fines, for all speeds are the "rule of the road" when it comes to automobiling on the water.

Power launches are by no means new things. For twenty-five years miniature steamboats have been used in America as tenders for yachts and to make short journeys. But they labored under the heavy handicap of being compelled to employ licensed engineers and firemen, and then they were weight-carriers, for the coal and water alone that was needed to run them frequently ran up to several tons.

A well-known firm of yacht architects built some of the first fast crafts of this kind, and they were pretty speedy boats for that day, but in 1885 the present type of motor, which is a development of a gas engine idea, came into use, and by substituting naphtha or gasoline for coal and water, the launch proper took its place among the delightful features of play life of the rich. Still these boats had little speed and were regarded more in the light of toys than as of practical utility. Then, by gradual development during the past ten years, the real automobile launch became a reality.

There are two distinct uses to which the automobile launch can be put. One is practical, forming a rapid and pleasant means of transportation. The second appeals to the sporting proclivities that are dormant in every man. It affords a splendid and most exciting means for racing on the inland waters of America and everywhere, in fact.

In this country autobooting has gone forward with leaps and bounds. The announcement that the American Power Boat Association will put up a racing trophy to be raced for the coming year has created keen interest. It will be called the American Power Boat Open Challenge Cup and will have a value of about \$500. This was settled at a recent meeting of the association which was held in New York City. The rules governing the rating and racing arrangements were also adopted and a committee was appointed to take care of the details of the race. This committee is composed of Henry J. Gielow, Atlantic Yacht Club; J. H. Wainwright, American Yacht Club; A. B. Cole and E. M. MacLellan, Manhasset Bay Yacht Club.

Another move which will help to popularize the automobile launch is the plan that is on foot to hold a national motor boat exposition from February 8th to February 20th in New York City. A large number of the 1,300 concerns which are interested in motor boats or their various parts will take part in this event and it should bring together the very best makes that this country and Europe can show.

On the New Jersey coast of the United States the oyster men are taking up autoboots, and a correspondent sends us the following about this new departure among men who are prone to adhere to time-honored customs: "Four boats of the oyster fleet have introduced gasoline as a propelling power in place of sails, now used on the other 400 schooners. It is thought that the use of gasoline will greatly increase the usefulness of the boats, as faster time and more trips to and from the oyster beds can be made. Much money is invested in the industry, and the owners of boats and oyster grounds are always on the lookout for a quicker and surer way of gathering the crops. The only drawback to the plan is the initial expense of fitting out the boats, but when this is done 150 gallons of gasoline will last during a week's work. Gasoline is worth about 10 cents a gallon, which would make the cost about \$15 a week. Gasoline is hailed with delight by the oystermen, as it does away with cold hands caused by excessive tugging and pulling at sail ropes."

New Mineral—Worth \$100,000,000 a Pound.

A SMALL glass phial about the size of a sulphur match and containing a whitish substance that looked more like common table salt than anything else came to America a month ago guarded more carefully than the big consignment of precious gems that traveled on the same ship. It was a little pinch of actinium, a substance even rarer and costlier than radium. It was sent over to Dr. George F. Kunz, the mineral and diamond expert of New York, whose experiments with radium, polonium, helium and kindred minerals are well known. It came from a man named Debierne, who discovered it while working in Paris in cooperation with the Curies, the discoverers of radium and polonium.

Actinium is priceless. Radium can be bought, though in a restricted market, for \$1,000,000 a pound. There is not a pound of actinium in the world, and if there was it would cost \$100,000,000. Nobody knows much about actinium. A faint idea of its power may be gained from the fact that its radio-activity is 10,000 times greater than the powerful uranium. Dr. Kunz has studied and experimented with the actinium sent him, but he is not yet ready to tell the public what he has learned. Last month Dr. Kunz

took the actinium before the Princeton Chemical Society and gave a demonstration of some of the wonders that can be performed by the salt. Scientists in New York who experimented with radium are waiting anxiously for the first exhibition of actinium here.

Actinium and radium are closely akin. They are both obtained from pitchblende, the refuse from uranium mines, as is also polonium, the first of these metals to be discovered. While the world was marveling at the discovery of radium Mme Curie and her husband were working to separate an elusive substance which they termed the "third element," coming after polonium and radium. They failed to isolate this substance, but M. Debierne succeeded in identifying this third element in pitchblende. He named it actinium, from the Greek word meaning ray. Long before his discovery the name actinium had been given by Phipson to a supposed metal.

The existence of such a metal had been suspected for fifty years, but the actinium finally discovered is far different from the metal Phipson supposed it was. He thought actinium was one of the elements of commercial zinc and that it might be separated.

Dr. Kunz says that actinium is a baffling study. "Actinium is one of an iron group of elements," said Dr. Kunz recently.

"It is somewhat near tutanium. It has been made in the form of oxide and chloride. While it hasn't the penetrative power of radium, it is remarkable from the fact that its emanations are very profuse for a time. Its radiations are invisible, except when placed near a diamond and some other stones, when it causes the stone to phosphoresce and makes a glow between itself and the stone. In the darkness actinium is only slightly luminous. In experiments that have been made nothing definite has been learned of its powers. It is supposed to lose its radiant energy after being exposed for a time and to regain its energy when shut up for a time. In my experiments I have not noticed the loss of energy. I exhibited the specimen before the Princeton Chemical Society and showed them its effect on diamonds."

Dr. Kunz said that it would be impossible to name a price for actinium. He said that it was one hundred times more rare than radium, and was accordingly more expensive to produce. Actinium may prove of value in the treatment of consumption. Actinic rays have already been used in the treatment of tuberculosis.

Possibilities of the Radium Industry.

AMERICAN interest in radium has been great and the magazines and newspapers have been filled with information about it. The following from Richard Guenther, the American Consul-General at Frankfort, Germany, tells something that may be new to many of our readers: "Notwithstanding the difficulty in its production (many tons of ore being required to produce 1 gram), a radium industry has already developed in Germany and France, and although 1 gram is sold at a little less than \$2,000 the manufacturers are said to have orders for several hundred grams. The demand for medical purposes exceeds the supply. Radium possesses all the important qualities of the Roentgen rays in addition to the invaluable property of being ready for use at any time and furnishes its rays without the employment of apparatus. It has been demonstrated that a small glass tube, not larger than a goose quill, containing a little more than a thousandth part of a gram, is as effective as an expensive and complicated electric apparatus for the treatment of cancer—surpassing the best effects of the Roentgen rays. The ease with which radium can be administered locally, as for instance in the nose or throat, is an invaluable advantage.

"The fact that radium exerts a very peculiar influence upon light-emitting bodies has given rise to the hope that it may eventually play an important rôle in the industry of life. A minute quantity of radium is sufficient to produce a strong light from a layer of zinc pyrites, and this light produces no heat, so that loss of energy is avoided. Radium rays, unfortunately, possess the dangerous property of injuring the human skin by producing severe burns."

Automobile Train for America's "Death Valley."

AN automobile train of motor or engine and several cars now being built in New York is designed to take the place and do the work of 1,200 mules, 240 drivers and save \$100,000 annually. For its use a macadam road 100 miles long will be laid over the shifting sands, through the rocky pass and along the mountain sides in the borax valley in southern California, better known as "Death Valley."

The engine is a movable power plant for generating and furnishing electricity. This engine will run along at the head of the train of cars and by means of a coupling tongue the current generated by the dynamo will be transmitted to the cars, each of which will be driven by two motors of its own. Each car weighs 9,000 pounds and is built to carry 15 tons. The total cost of train is to be \$30,000.

Automatic Machinery.—The F. B. Shuster Company, New Haven, U. S. A., has issued a new catalogue, giving particulars of machinery which it manufactures for the purpose of straightening, cutting and riveting, copies of which will be furnished to readers of THE AMERICAN EXPORTER who may be interested and apply to the company for the same. The catalogue is complete and comprehensive.

MILLS NOVELTY CO.

INCORPORATED.

CAPITAL, \$500,000.00.

CHICAGO, U. S. A.

The Mills-Chicago.
With Music Box.
Weight, boxed for
shipment abroad,
about 340 lbs.

in the world of all kinds of

Coin-Operating Machines.

Our 80-page catalogue, just issued, profusely illustrated, in colors, describing the many styles of **Coin-Operating Machines** made by us, will be mailed post-paid to all parts of the world.

Nearly all our Coin-Operating Machines can be made to be operated by the coin of any realm.

All machines are boxed ready for steamer, and prices quoted will be f. o. b. cars New York or San Francisco. Orders received through export houses. When ordering through export houses specify MILLS NOVELTY CO.'S COIN-OPERATING MACHINES, and to avoid errors, please mail us duplicate of order.

Embossed Metal Ceilings,

SIDE WALLS AND CENTER PIECES.

Large and Complete Line of Classified Designs.

New Catalogue "A" sent on request to those interested.

SPECIAL PRICES FOR EXPORT.

J. H. ELLER & CO.,

CANTON, OHIO, U. S. A.

I. E. PALMER,

Middletown, Conn., U. S. A.

Manufacturer of

Hammocks, Mosquito Nettings and Canopies, Dress Linings, Window Screen Cloth and School Bags.

No. 122E—Size, 35x78 inches, with spreader; assorted colors. Price, \$5.80 (£1 4 1) per dozen net.

No. 14SE—Same as above, with addition of pillow and wide valance; assorted colors. Price, \$11.26 (£2 7 1) per dozen net.

No. 64SE—Size, 43x82 inches; with pillow, wide valance and spreader; assorted colors. Price, \$26.00 (£5 8 1) per dozen net.

No. 64SE—Same as above, except "narrow valance" in place of "wide valance." Price, \$21.50 (£4 10 0) per dozen net.

Descriptive and Illustrated Catalogues furnished on application.

We manufacture Hammocks of all sizes and prices. The Utopia Hammock is patented in all the large countries of the world.

No. 726—Trapeze with Arawana Hammock. Trapeze to be used with this or any hammock. Price, of trapeze alone, \$19.80 (£4 2 0) per dozen net.

No. 44SE—Arawana Hammock (without trapeze); size, 39x81 inches; with spreader, pillow and wide valance; assorted colors. Price, \$20.95 (£4 2 1) per dozen net.

No. 728—Hammock Support with Utopia Hammock. Adjustable support (to be used with this or any other hammock). Price, of support alone, \$45.00 (£9 6 1) per dozen net.

No. 687—Utopia Hammock (without support); with spreader, adjustable pillow, wide valance and seat. Price, \$39.90 (£8 5 0) per dozen net. Adapted for indoor and outdoor use. Degree of recline easily changed from sitting to sleeping position by extending or contracting the frame.

These prices are NET, free on board New York.

No. 689—Canopy, Umbrella Top; 90 inches high, 9 yards around. Price, \$1.05 (£0 5 3) each net.

Rochester, N. Y., U. S. A.

LITTLE'S SATIN-FINISH CARBON.

LITTLE'S CARBONS will not dry out under any ordinary circumstances, in any climate. No Carbon made under any other process than Little's can give this guaranty, and there can be no imitation of Little's process in carbon making; attempts to steal it have resulted in permanent injunction; and contempt of Court is an untried way to business success.

Little's famous brands, "Cobweb" and "Satin Finish," are known and used all over the world.

Little's Carbon Papers are better than all others because: They do not smut. Impressions from them in many instances can hardly be told from those made by a ribbon. They are not sticky or greasy, yet they do not dry out and do not spoil with age, or in any climate. They last longer than any others. The color is denser, stronger, more permanent than any other. It is evenly spread by automatic machinery.

Most other Carbon Papers look alike. Little's looks different. It is different, being made differently by a special process, and it does different work. Send for Catalogue. Orders received through New York exporting houses at export rates.

Effect of Proposed New British Duties.

A LONDON correspondent of the *American Machinist* sends to that paper an interesting account of the effects upon the machinery export trade of America that are likely to ensue through the proposed new tariff conditions. The correspondent treats the matter with obvious fairness, and some extracts from it will interest purchasers of American goods everywhere. In fact, the entire letter would be interesting, but we have only space for the following extracts:

"Inquiries have been made throughout the British engineering and machinery trade with reference to the proposed duties on foreign imported manufactures. Out of a representative opinion only 4 per cent. of such firms are against the proposed duties, because they think that users of machinery in England would have to pay the duties, and that they would increase foreign and colonial competition. Of the remainder 42 per cent. believe that a 10 per cent. duty would not exclude machinery; 34 per cent. think that duties would do so, while 20 per cent. do not believe they would have any material effect. There is a very general view held that a 10 per cent. duty would not injure British exports of machinery and would slightly reduce imports.

"The contingency of the United States being excluded from the British market is not lost sight of, although it is thought that if that were so the States might turn their attention with extra energy to other places where they now compete on equal terms. It is conceded that, under new fiscal arrangements, many articles in the machinery and engineering section now imported from Germany and the United States would be made in Britain. Personally, and writing from my own knowledge of the South African and the general colonial markets, I do not believe that the preference at present accorded by South Africa will be of any material advantage. Any preferential duty less than 10 per cent. (and that is rather too low) will fail to give British exporters sufficient advantage to justify its imposition.

"It may be assumed that any tariff legislation in England would apply to the colonies, otherwise it would simply be useless and would lead to United States factories being established all over Canada. The proposed 10 per cent., it is said, would not exclude electrical machinery, but might exclude the importation of electrical manufactures and accessories. In another branch of the engineering trade the opinion is that wherever an article made abroad is better than the same article made in England, a 10 per cent. duty would not exclude it, nor would it probably diminish its sale here."

Study of American and British Methods.

CHARLES T. YERKES, the American who did wonders for London's underground transit facilities, has come out in an interview in the *New York World* with some interesting observations that are evidently sincere and that are unquestionably based on practical experience.

"So far as Englishmen are concerned," said Mr. Yerkes, "I want to tell you that when you meet with the better class Englishman, the well-born, the well-brought-up Englishmen, one who knows something of business and is unspoiled by flattery, you have met a man upon whom you can depend on for his friendship, his honesty and his bravery till the end. That sort of Englishman is just the best man on earth, and there are plenty of them in England.

"Life in England, all things considered, is pleasanter than life in America. They do not take things so seriously—small things, I mean—as they do in America. In America, and particularly in New York, you see thousands suffering from hustle out of place and overemphasized activity. Men rush out from their offices to luncheon, worry through that and rush back to their places of business as if the fate of the nation depended on their gaining a moment's time—and when they get back to their offices, stores and shops nine out of ten of them find they have been hustling so much that they have had no time to attend to any business in hand or bring it to hand if they lacked it.

"The Englishman is slower, steadier and surer, but altogether he is one of the best specimens of the genus homo the world has ever produced. I never met a better one. Another pleasant thing about life from the English point of view is the way they look upon sport and holidays over there. They have more holidays than we have here and they relax more for them. In the matter of sport, racing, cricket, rowing and all forms of physical competition are looked upon as national institutions that it is the duty of every Englishman to uphold and encourage.

"In America the better-class people regard all forms of sport, with the possible exception of football, as only of interest to 'sports' and half-grown boys. The Puritan strain in us makes us look with distrust upon even the best of men who race horses. But in England it is the great ambition of almost every wealthy man of station to own a horse that will win some of the classic events of the English turf, such as the Derby. And it is nothing unusual to see two cricket elevens composed of solid and corpulent middle-aged gentlemen heatedly and tirelessly playing a match game of innumerable runs and many hours' duration.

"America's progress is due to the fact that her men begin the battle of life early, when they are full of enthusiasm and energy and, when they are most adaptable to existing conditions—in their teens. A boy who goes into business at 17 or 19 has seven years, say, the start of a college man, and the college man must begin in a small position and at a boy's pay—begin where the boy began—and naturally this dissatisfies the college man. And a man dis-

satisfied is a man that is spoiled for the day's work. In this, of course, I am speaking of commercial and business life, along lines where experience and common sense are needed more than technical knowledge.

"Common sense is better than a high education, anyway. The man with common sense can always get an education, but the best education in the world doesn't bring you any more common sense than what you were born with. As for success. The component parts of success are a level head, an honest intention, industry and perseverance and—and this is important—just a dash of good luck."

Amusing Features of Emigrant Traffic.

THE keen competition for carrying the enormous number of emigrants from northern Europe to New York is not without its amusing features.

During the cholera outbreak of 1893 the Prussian Government persuaded the North German Lloyd and Hamburg-American lines to undertake to pass Russian emigrants through steam baths, disinfect their belongings and see the emigrants across the sea or return them to Russia or Austria, as the case might be.

Expecting to thus get a monopoly of the business, the companies spent millions for so-called "controlling stations" at eleven of the principal points on the eastern frontier, with baths, hospitals, steam-cleaning establishments, lodging barracks and offices. All emigrants are compelled to stop at such stations by the police, who have acquired rare skill in recognizing emigrants. Unless the emigrants could satisfy the German lines of their ability to pay their passage to the United States and get through Ellis Island they had to go home.

The rival companies never sent agents to Russia to drum up business, but a considerable portion of the emigrants turned up at the stations with prepaid tickets from America, which often read over non-German lines.

The difficulties on this ground finally led to contracts with the Red Star, Holland-America, White Star and American lines, the German companies agreeing to give the two former their overflow business in the flush season and recognize the White Star Line and American Line prepaid tickets.

Until the present time Russian and Austrian emigrants could pass through Saxony, where there were no control stations, but Saxony has just decided to imitate the Prussian example of sealing the eastern frontiers except through the North German Lloyd and Hamburg-American companies' stations. The closing of the hole in the German drag-net is occasioning caustic comment by the competing companies, which demand that the German governments administer the stations impartially and recognize the tickets of all companies. But this is not likely to be done, the governments being glad to get rid of the expense.

Extensive Dredging Operations by United States.

AN indication of the large amount of river and harbor improvement work now under way or contemplated by the United States Government is given by the fact that at present ten suction dredges are being built for use in various parts of the country. The contracts for building these vessels have been distributed among a number of builders, chiefly for the purpose of hastening their completion.

The mechanical equipment of the dredges for salt water service will include surface condenser outfits with Blake air-feed, fire pumps, etc. The dredges for fresh-water duty are provided with very large Blake air-pumps and condensers. The air-pumps are of a very novel arrangement, inasmuch as it is possible by the manipulation of valves and cocks provided for the purpose to cut each pump in half and run one side entirely independently of the other side. This practically provides a spare pump in each installation without the necessity of being overweighted with two duplicate machines, and at the same time secures the advantages of compound steam cylinders.

These dredges are the largest in capacity ever built, and are designed in each case for the special work which they will have to do. They are self-propelling, sea-going dredges and do not depend upon the assistance of tug-boats or other craft to move them around from point to point. Some of these vessels are fitted with immense bins in which the dredged material is deposited, and, when full, the vessel propels herself out to deep water, dumps the sand or mud and steams back to repeat the operation. Others are arranged for depositing the dredged material into large scows fastened alongside the vessel.

Slow Progress of Wireless Telegraphy.—THE AMERICAN EXPORTER, in an editorial last April, reviewed the difficulties that would be encountered in putting wireless telegraphy into practical commercial operation. At the beginning of the new year 1904 a writer in the *National Magazine* has this to say about the present situation: "When Marconi startled the world in December, 1902, with his amazing achievement of receiving the electric signals from Poldhu, England, at St. John's, Newfoundland, the utter and speedy overthrow of the cable companies was predicted on all sides in the first flush of the new marvel. But the anticipated progress not having been made by the wireless agency since then, and a host of other investigators having arisen to dispute Marconi's supremacy, the inevitable reaction has occurred, and now the opinion prevails that however successful wireless telegraphy may speedily prove itself to be, the displacement of the cables need not be expected for many years."

De Laval Cream Separators.

Immediate and absolutely complete separation of cream from milk by machinery.

400,000 Machines in Use throughout the Dairy World.

A saving of 10 to 25 per cent. in any climate, and 25 to 100 per cent. in warm countries.

Portable Galvanized Iron Ovens.

Portable Oven No. 116—Open.

We make the kind the United States Government buys and which is being adopted by Foreign Governments as well as by those interested in the economical baking of the products of flour, meat and vegetables. Either Coal, Wood, Natural or Artificial Gas can be utilized as Fuel. Used by Bakers, Hotels, Steamships, Restaurants, Confectioners, Colleges, Asylums, Private Residences and in Japanning, Enameling and Core Baking.

FOR FOREIGN MARKETS ONLY:

Upon receipt of price (as below) in U.S. Gold or its equivalent, we will deliver F. O. B. Cars New York, boxed ready for steamer, as follows:

PORTABLE OVEN No. 114—Has three shelves (28x20 inches each shelf) holding at one baking Thirty Large Loaves of Bread. Weight, boxed, 300 pounds. Price.....\$ 37.50

PORTABLE OVEN No. 116—Has five shelves (33x20 inches each shelf) holding at one baking Sixty Large Loaves of Bread. Weight, boxed, 500 pounds. Price.....\$ 62.50

PORTABLE OVEN No. 119—Has ten shelves (38x20 inches each shelf) holding at one baking One Hundred and Sixty Large Loaves of Bread. Weight, boxed, 1000 pounds. Price, \$125.00

Orders received direct or through export houses. When ordering through export houses, to avoid errors, please mail us a duplicate of order.

Progress in American Business Methods.

NOT so many years ago purchasers of goods in the United States, as well as in other modern countries, were expected to take away with them the articles that they bought. Competition forced merchants to deliver goods, and manufacturers also have been coming into the custom of doing away with the f. o. b. (free on board). In other words, there is a growing disposition, both in the retail and wholesale American trade, to make a price to the buyer and deliver the goods to him without further trouble or expense. In the export trade this new principle is attended with some difficulties, but it will all be worked out eventually.

In New York City the delivery of goods can be called a science. We have in a previous issue shown the enormous amount of work that is done by the employees who look after the deliveries in the great stores. Even a needle is sometimes delivered, if the purchaser does not want to carry it away, and not so long ago a needle, price 1 cent, was delivered in the regular course of business by a big New York department store to a customer residing in a suburb ten miles away from the store. There was no profit in the transaction, as may readily be understood, nor was there any attempt on the part of the firm to secure an advertisement on account of it. The transaction was made in good faith on the part of the purchaser (a lady), who did not wish to carry the needle with her, but it is proper to say that she was a regular patron. From her account of it the disposition of the purchase was of the most ordinary nature. No remonstrance was made on account of price or distance, and the clerk who sold the needle made no remark to show that it was an unusual event. It was simply an incident in a marvelous system of delivery. Some of the New York stores deliver goods from anywhere within a radius of thirty miles of the city, and several of them have extensive stables in outlying sections, where their horses and wagons are housed to care for suburban deliveries, but none of them would make a regular practice of delivering needles. One store in New York expends over \$150,000 a year in the maintenance of its stables for the delivery of its goods to retail purchasers. Another store is reputed to spend even a larger sum, and there are several others that find it necessary to spend large sums to come somewhere near to their larger rivals in order to compete for the trade of the metropolis of the New World.

In the New York stores until recently there were cashgirls and cashboys, but now communication between the clerks and cashiers in the progressive ones is carried on through an automatic device, which is quicker and more certain. A modification of this method of communication is soon to be applied to the delivery business. A writer in the *National Magazine* has this to say about it: "And as surely as electric flyers will crowd out the trundling horse-omnibus, pneumatic tubes will supersede all sorts of delivery wagons. Fifty cents' worth of lima beans needed, telephone to grocery at 8 P. M., reply at 8.03, arrival of tube consignment at 8.05. Mistake? No canned things wanted on account of noxious preservatives? Prefer beans in five-pound bags? Return cans; arrival of second consignment at 8.09; transaction finished in less than ten minutes.

"Letters and newspapers will be forwarded in the same manner, and postage problems will be solved by telephone. Also the emergencies of over-size packages. The distribution office will send them either by district tubes or at consignees' option by special messenger. Automatic safeguards will prevent collisions, and after market hours delivery tubes will be used by circulating libraries, express offices, mechanics and artists. But tubes, as well as trolleys, will have to compete with steadily improving airships."

Only 10,000 Millionaires in the World.

IF there are 100,000 millionaires in the United States, as Senator Depew said at a recent dinner given by John D. Rockefeller, Jr., then both an official of a great commercial agency and the president of one of New York's richest banks are decidedly in error. Each places the number of millionaires in the entire world at 10,000. There are 7,000 in the United States; and 1,000 of these live in New York City, whether they pay taxes here or not. The financial Red Book, a most carefully compiled publication, gives the names of practically all the persons in the United States who are supposed to be worth more than \$300,000. And there are only 15,000 names on the list. No claim is made that the name of every person worth that amount or more is given, but the proportion of those left out is extremely small, for a most exhaustive investigation has been made.

"There may be a few more than 7,000 millionaires in the United States," said the official of the mercantile agency. "I doubt it, however. I also doubt if there are more than 1,000 millionaires in New York. It is absolutely impossible to tell accurately. It may seem strange that we should not be able to tell, especially when we are engaged in finding out how much a man is worth and giving such information to our subscribers. But in the last few years there has been a marked tendency among men of wealth to conceal the amount of their worldly possessions. The first incentive in this respect is the vulgar prominence given to the man that has lots of money.

"There are other reasons men have for suppressing knowledge of the amount of their wealth. Some wish to avoid heavy taxation and give false returns. Another man may have made his money in a business not commonly supposed to be especially lucrative, and he does not care to have his affluence

blazoned forth to arouse competition. So, while it is impossible for us to tell exactly how many millionaires there are, we would not take the number of those who are known to possess a thousand thousands at least and then multiply the number by ten. For that is what Senator Depew seems to have done in his anxiety to urge Mr. Rockefeller's young men to get rich."—*New York Press*.

Successful Men Who Are Not Rich.

THE ability to make money is undoubtedly the popular proof of success nowadays, but, nevertheless, there have been men who have put their ideals ahead of money-getting. Writing in *Everybody's Magazine*, Francis Bellamy says:

"There was Agassiz, who refused to lecture at \$500 a night because he was too busy to make money. Charles Sumner declined to lecture at any price, because, he said, as Senator all his time belonged to Massachusetts. Spurgeon refused to come to America to deliver fifty lectures at \$1,000 a night, saying he could do better; he could stay in London and try to save fifty souls. Emerson steadfastly declined to increase his income beyond \$1,200 because he wanted his time to think.

"Such stories of fine haughtiness did not seem quixotic to the young men in college thirty years ago. In spite of all the change that has taken place in the popular estimate of success, there is a great multitude of hardy souls who have refused to be swerved from their own ideals of a success which is unrelated to money.

"These people are all cherishing a certain ideal of excellence. We like to think of Mr. Howells, for instance, who has a standard of work infinitely more important to him than his now handsome remuneration. St. Gaudens got \$30,000 for his statue of General Sherman at the gate of Central Park in New York. But he was three years in making it, and he was a lifetime in making himself able to do it.

"The men who to-day dare to undertake pursuits where distinction of mind, or the glory of doing a fine thing, or personal influence in a wholesale direction, is the chief attraction, have certainly a true perspective on life. They have a correct world sense, at least. If they succeed they can't be cornered out of their resources. And it is a good deal to escape heartburn."

Railroad Cars That Are Traveling Bridges.

EVEN in this age of wonders no one would expect to experience the doubtful pleasure of a head-on railway collision without the usual horrors of a smash-up, yet that is put forward by an inventor for his most recent invention. A single track is used, on which railway cars are caused to travel. Two cars go head-on for each other, at a speed of twenty-five miles an hour. They approach within the danger limit, and suddenly the car having the right of way runs over the other and lands on the track again, where it continues in safety until it reaches its destination. The under car has proceeded as if nothing had happened.

The cars, although they run upon wheels, are really traveling bridges, with compartments for the accommodation of passengers. Over the framed structure of the cars thus constituted an arched track is carried, fastened to the car and serving the purpose of providing a roadbed for the oncoming car. The forward ends of the pilots of the superimposed tracks are provided with rollers and skids, which are so designed that one car shall mount the other without shock. The skids gently ride up the inclined track of the car ahead, and sufficiently elevate the rollers of the pilots to permit them to run upon the superimposed track without jar. The car itself follows with a motion equally as gentle. In actual practice cars of 11 feet 6 inches in length will be employed, the extreme length being 43 feet.—*New York Tribune*.

Technical Education in America and Abroad.

MR. LOUIS DUNCAN, in the *Engineering Magazine*, discusses a subject that is of growing international interest. It is that of technical education, which, he says, has taken individual shapes in Germany, America and England. In Germany it combines with the painstaking acquirement of knowledge, typical of German education, an idea of research; in America it is the old-fashioned general collegiate education modified by paying special attention to technical subjects, with a veneering of manual training; in England to-day it is chaotic, but with a tendency to keep technical education on a trade basis.

As far as facilities go, Germany depends upon State aid, which has been liberally supplied; America, to a large extent, upon personal contributions, while England is in the unfortunate position of having little State aid and no large benefactions.

The aim of technical education is to apply scientific discoveries to practical work. When any new discovery is made in science, there are two attitudes to be considered: The first is, how can I develop this discovery; the second is, how can I apply it. Germany, without neglecting the second attitude, has added to its technical instruction the first attitude—that is, the Germans combine research with application. In America it is only lately that technical education has concerned itself with research work.

Steam—ENGINES—Gasoline.

We make a specialty of Steam Engines and Gas and Gasoline Engines and Pumps from a 1 H. P. Combined Engine and Boiler for \$100 and a 2½ H. P. Gasoline Engine for \$125 up to any size in either Vertical, Horizontal, Marine, Hoisting, Pumping, Locomotive and Portable Engines on Wheels.

We also make a full line of Saw Mills and Wood-working Machinery, Turbine Water Wheels, Corn and Wheat Mills, Feed Grinding Mills, Sugar and Plantation Machinery, Cars, Locomotives and Track, Etc.

Send for Catalogues A, D, G, O and W. Correspondence solicited.

KALAMAZOO HARP.

KALAMAZOO TROLLEY WHEEL.

Thousands of Protectographs

Are now in daily use by the leading financial, industrial and mercantile institutions of America, and are exclusively employed by the United States Government.

The machine is a marvel of simplicity, being but six inches square and weighing only ten pounds, boxed ready for shipment. One movement of the lever indents the limiting line upon any preferred part of the check (see reduced facsimile of check) and by its system of compound levers forces an especially prepared indelible ink into the fiber of the paper, making it a part of the document itself and rendering its removal impossible.

The Protectograph is made to conform to the monetary standard of all countries and to print in any language. The price is \$30, delivered New York City.

G. W. TODD & CO., Mfrs., 40 Trust Bldg., Rochester, N. Y., U. S. A.

EXCLUSIVE AGENCIES GIVEN.

Orders executed either direct or through export commission houses.

ONCE SOLD, THEY NEVER COME BACK.

OCEAN WAVE WASHERS

Wash the clothes as easily and cleanly as sea waves wash the beach.

OVER 100,000 NOW IN USE.

Shipping weight, 85 lbs.

Size, 2 x 2 x 3—12 cubic feet.

SPECIAL FEATURES.

Our Gearing: Simple in construction; impossible to throw out of gear; the longer it is used the easier it will run. Our Fly Wheel has no threads to strip; no nuts to lose, being attached or detached in a moment's time. Our Improved Dasher is hand-turned; clothes do not cling to it and tear. We assure free action of dasher by using heavy galvanized flanged ring in dasher block, thereby relieving all friction. In general construction of tub and finish, only best materials are used. We ship through any responsible New York exporter. All orders must be sent to us direct.

WILLIAM D. WARNER, PROVIDENCE, R. I., U. S. A.

SOLE MANUFACTURER AND EXPORTER OF

Herculene Cold Water Paint.

Used both for outside and inside work. Sanitary, fireproof and durable. A substitute for paint, whitewash and kalsomine. Packed in dry powder form. Five pounds make a gallon of paint. Used universally in factories, warehouses, public buildings, etc. Orders filled through commission houses. Correspondence solicited. Catalogue D on application.

GREETING TO WHOLE WORLD.

New Year Signals Are Sent by the United States All Around the Globe.

THE United States Naval Observatory sent telegraphic time signals around the globe to mark the beginning of the new year, 1904. At the time this issue of THE AMERICAN EXPORTER goes to press we have not learned the result of the experiment, but the following announcement showing the scope of the plans of these United States officials to send a New Year's greeting throughout the world will be read with interest:

"The signals were sent out last year for each of the four great standard time belts of the United States. This year it is proposed not only to secure a wide distribution of these new year signals throughout North and South America by the cooperation of the telegraph and cable companies, but also to send one or more of the four series of signals around the world and back to the room of the Naval Observatory where they started.

"The signals will begin at 11.55 P. M. and end at midnight, Eastern time. The same series will be sent out an hour later, ending at midnight, central standard time; again an hour later, ending at 2 A. M., for midnight of mountain standard time, and again an hour after that, ending at 3 A. M., for midnight of Pacific Coast standard time. During each of these four five-minute intervals the transmitting clock will send an electric impulse practically every second.

"On the world circuit the signals will go by land lines to Cape Canso, N. S., thence by cable to the Azores, Lisbon, Gibraltar, Malta, Alexandria and Port Said; by land to Suez, by cable to Aden and Bombay, by land to Madras, by cable to Penang, Singapore, Saigon, Hong Kong, Manila, Guam, Midway, Honolulu and San Francisco, and by land back to Washington. It is proposed to receive both the outgoing and incoming signals on the same chronograph at the Naval Observatory, and thus preserve a permanent graphic record of both on a single sheet of paper.

"It is suggested that, besides demonstrating the possibilities of practical astronomy and telegraphy, working together through international cooperation, benefits will result from the general attention that it will direct to the advantages of the use of accurate standard time throughout the world. The messages also will carry a New Year's greeting to the world."

American Enterprise in South Africa.

SOME interesting facts about American trade interests in South Africa are given in the recent elaborate and painstaking report made by Henry Birchenough, the special commissioner appointed by the British Board of Trade to investigate trade conditions and prospects in that region. The report is remarkable for his warm praise of American business methods as shown in that portion of the British Empire. As regards the prospects in the South African colonies, Mr. Birchenough's optimism is as frank as his admiration for the American way of doing things, and to aid the British merchant and manufacturer to take advantage of the one and compete with the other he furnishes a mass of information which cannot but be advantageous to Americans who have or contemplate trade relations with the Transvaal or the Orange River country. The report would fill several pages of THE AMERICAN EXPORTER, and we have room only for a few extracts:

"America is undoubtedly our most formidable rival present and future. The actual amount of her imports (into South Africa) of competitive articles is not very great—it is about one-half of her total importations—but it is growing rapidly both in volume and variety. It is impossible to visit ports, warehouses, stores or mines without being struck by the extraordinary vitality of American trade in South Africa. American manufacturers have confined their attention chiefly to the trades in which the natural resources of their country, or their experience at home of conditions similar to those which prevail in South Africa, or their well-known ingenuity and inventiveness, give them special advantages. This is why they have been able to dominate the trade in agricultural implements and in steel frame construction and to obtain so firm a hold upon all departments of mining machinery. Apart from foodstuffs and natural products in which there is rivalry with Australia and not with Great Britain, American competition is found to concentrate itself mainly upon a comparatively small number of very important articles, of which the following are the principal:

"Agricultural implements and appliances, mining machinery, electrical machinery and equipment in all its branches, steel frame construction, machine tools for workshops, small steel tools of all kinds, wire for fencing, etc.; cheap furniture known as 'knock-down' furniture, carts, carriages and vehicles of all kinds, and goods in which wood plays an important part. A few manufactures, such as boots and shoes, hats, lamps, stoves, canvas, watches and clocks, typewriters, cash registers, saddlery, etc."

The following analysis of American imports for the year 1902 is interesting: Machinery, £387,650; metals and manufactures of metal, £612,869; various manufactured articles, £1,145,232; foodstuffs, fodder, timber and natural products, £2,284,088; total, £4,429,839. Germany comes third on the list with a total of £1,789,352, and her ratio of increase is but little below America's.

Mr. Birchenough prefaces his enumeration of the reasons for the rapid

growth of American trade with the following, to his own countrymen: "The important point is that our manufacturers should become aware of the weak places in their organization and should study and appreciate those methods of their rivals which have brought them success and are worthy of imitation." He then takes off his hat to the Stars and Stripes as follows: "The ingenuity and inventiveness of the American people constitute an initial superiority. * * * The Americans are constantly introducing novelties to save labor and multiply conveniences, and with these they naturally tempt colonial buyers. * * * Another great advantage the Americans enjoy, though it can perhaps hardly be called a natural advantage, lies in the fact that their manufacturers have had in their own country to deal with conditions very similar to those which prevail in South Africa, so that they come into the market with an experience which the British have slowly to acquire. * * * Still the general impression one forms in South Africa is that foreigners, and especially Americans, owe much of their success to the extraordinary activity and alertness they show in the conduct of their business and the careful measures they take to retain and extend their connection. * * * They succeed in making their customers feel that buyers and sellers have common interests. * * * Instead of endeavoring to force the sale of goods they are in the habit of making they strive to find out what their customers really want and make it for them. * * * It has been said that the Americans are brought up with the idea that whatever is done can be better done, and it is just this attitude of mind which makes them such formidable competitors."

The commissioner preaches eloquently of the advantages of standard types in American machines over the British method of working to special gauge on each, and cites many instances of prompt replacing of broken parts on American-made machines and the vexatious delays arising when similar repairs were to be made on an English-built one. On this point he quotes a Government inspector of machinery in the Transvaal as saying: "The facility for effecting repairs induces people to purchase American-built machinery when otherwise they would prefer English"

Coming down to smaller articles of trade Mr. Birchenough admits that "in looking over a merchant's stock one quickly becomes able to tell which are American and which are British goods by the superior smartness and neatness of the former." He then proceeds to read his countrymen a lecture on the advantage of careful packing, a matter which is of especial weight with the South African buyer, and adds: "At Port Elizabeth I was shown a mixed American cargo of over 5,000 tons, in which there was hardly a single breakage discovered, although a considerable portion consisted of very fragile goods."

Of the many other points of interest the following is one: "At the present time there is extraordinary activity in the building trade in all the South African colonies, and the demand for building material of all kinds is enormous. Of actual materials Great Britain cannot expect to provide more than a portion. A most important and comparatively new development of the building trade in South Africa which calls for immediate attention of British manufacturers is steel skeleton frame construction. This was introduced by an American firm in the first instance in the erection of the type of tall buildings known in America as 'skyscrapers,' but it seems likely to extend to other classes of buildings and to become a very important branch of trade. The Americans have undoubtedly exhibited great enterprise. When they appeared on the scene they showed drawings and photographs, and offered to make detailed plans and to calculate all strains for architects and to quote a price per ton, inclusive of the cost of erection. The offer of all these facilities was naturally extremely tempting, and as there was no effective competition they for a time carried all before them. Several most important buildings of this character have been constructed or are under contract at Cape Town and still more at Johannesburg."

American Goods Appreciated in Italy.

DESPITE the fact that more liberal credits are given by the merchants of other countries, Pietro Cuneo, the United States Consul at Turin, reports that, despite lack of good transportation facilities, there is an increased demand for American products in Italy. Mr. Cuneo says in part: "Americans have the monopoly of the trade here in sewing machines, typewriters and cash registers. I am often agreeably surprised to find many other American products in this market, such as radiators, printing presses, bicycles, stoves, cooking utensils, canned meats and other articles of food. I have noticed considerable American machinery in this city, and dealers speak in terms of praise thereof, but complain of the transportation cost to get it to this market. A dealer showed me samples of American cut goods for the manufacture of shoes, and told me that considerable quantities of such goods are imported into Turin."

Agricultural Schools in Spain.—United States Vice-Consul Adolphe Danziger, writing from Madrid, says that the Government of Spain is to open fourteen agricultural schools in various parts of the peninsula. They are to be practical means of educating farmers not only in regard to the crops raised, but in the use of agricultural machinery and implements. While they will be governmental institutions, the contracts to equip them will be let to private parties and bids are soon to be asked for. It is probable that American machinery will be selected.

THE INGERSOLL AMERICAN WATCHES

THE Ingersoll watches as shown here have revolutionized the watch trade of the world. They have established new standards of value. Buyers of watches, in justice to their own interests, must consider this line. Foreign buyers have long been accustomed to purchasing cheap watches, both cheap in name and quality, but we now offer an opportunity to purchase watches guaranteed to keep good time at very low prices.

Our watch factory is the largest in the world devoted solely to manufacture of timepieces. The output is five thousand watches per day, which go to all parts of the world.

NEW JERSEY PAINT WORKS,

HARRY LOUDERBOUGH, Proprietor,

JERSEY CITY, N. J.

U. S. A.

Remarkable Fact.

This cut is a copy of a photograph of a board having one end painted with New Jersey Copper Paint, manufactured by Harry Louderbough, proprietor of New Jersey Paint Works, Jersey City, N. J., U. S. A., and placed in the water at Port Royal, S. C., for five months. Upon the unpainted end you can note the ravages of the salt-water worm so destructive to wood, and also the large number of barnacles that have fastened upon it. Observe the painted end, where New Jersey Copper Paint was applied—its splendid condition.

A PAINT THAT PROTECTS.

The board here represented was placed in the water at Port Royal, S. C., by me, and left in the water five months. The painted end was as good as when it was placed in the water.

Patent No. 738160—150 candlepower—saves 80 per cent. of gas and gives a beautiful electric effect.

Never Blackens Mantles.

Incandescent Burners, as generally constructed, give much annoyance and trouble always to get the exact mixture of gas and air to make the most effective combustion, but with "Suvlight," by the simple movement of the thumb, the exact proportion of gas and air and the highest possible illumination are instantly obtained. Adapted for all kinds of lamps, mantles and any variation of gas pressure. It is the long-felt want in private and business houses. Write for lowest export prices.

"SUVIO" GAS HEATERS

Introduced into the Whole World. Good for All Seasons, "Suvio" has stood the test of time. Name "Suvio" and Patent Nos. 571916, 27876, 575305 stamped on top of each heater. If you handle similar heaters be sure they are not infringements, and thus render yourself liable for damages. "Suvio" is the real thing—better and cheaper.

PERFECT PROTECTION.

PERFECT RELIABILITY.

PERFECT SIMPLICITY.

THE WAGGONER WATCHMAN CLOCK

Reduces the Rates of Insurance.

A watchman clock, or recorder, is a device to be placed in the office, connected by wires to various stations about the premises, which the watchman is required to visit at regular intervals. The watchman records his visit at each station, which record is transmitted to the clock and recorded on a paper dial, showing the time and station registered. The watchman **does not have** access to the clock containing paper dial upon which his visits are registered.

There is not a manufacturing concern of any kind or description in the entire world but that is in need and a possible purchaser of a **Waggoner Watchman Clock**.

As many stations as desired can be connected to one clock. To introduce abroad we are shipping (boxed ready for steamer, f. o. b. New York,) **One Waggoner Watchman Clock**, with apparatus for four (4) stations, upon receipt of \$50.00 in U. S. money or its equivalent. The charge for each additional station is \$5.00.

With the view of increasing our foreign connections, we desire to correspond with leading business firms of undoubted facilities and financial standing in each trade center of the world.

Our Illustrated Catalogue, describing in detail the Waggoner Watchman Clock, mailed postpaid to all parts of the world.

Cushman & Denison Mfg. Co., 240-242 West 23d Street, New York, U. S. A.

OUT-HATCHES ITS COMPETITORS!

Why does the Reliable Incubator give such remarkable results—hatching 85, 90, 95 per cent. of the fertile eggs? Because our heating, regulating and ventilating systems give pure, vitalizing oxygen to germ and growing chicks. Other reasons why the Reliable is a profit-bringer are its durability, and economy of time and material. It has double top and bottom, made of best kiln-dried lumber, so treated as not to absorb moisture.

Reliable Incubators

have trays so constructed that it's easy to reach either eggs or chicks. Remember, too, that the Reliable out-hatches its competitors so often because the heat in corner or center is always the same temperature—a mellow, even heat in every cubic inch of the egg chamber. Our new catalogue is free. It tells a lively story giving warnings, and simple, yet full instructions on hatching and raising poultry successfully. Just send 10 cents to pay postage.

MANUFACTURERS AND EXPORTERS OF THE

Cady Carpet and Rug Beater

and Other Specialties, in House Furnishings.

Beats all dust raisers. It is practically two beaters in one, as the illustration shows.
Is made of coppered steel wire and is 30 inches long. The four wires are twisted together,
going from one-half to two-thirds, and one clear through the handle, securing the same
permanently in place. Orders filled through commission houses. Correspondence solicited.

TO ADVERTISERS.

THE AMERICAN EXPORTER is the only *independent* and *impartial export paper published*. It is *independent* because its publishers are not engaged in any other branch of the export business. They are neither export commission merchants nor manufacturers' selling agents, and hence they are under no more obligations to one advertiser than to another.

It is *impartial* because it treats all its patrons alike. It cannot, for this reason, and it does not, publish write-ups or puffs of any specific make of goods, no matter whether advertised in it or not. It charges the same price for the same services to all alike.

We desire it distinctly understood by those who contemplate advertising in THE AMERICAN EXPORTER that space for advertising purposes is sold only upon the merits of the publication for that purpose. For this reason no advertising solicitor or agency has any right or authority to agree to give reading notices or to perform any special service whatever to obtain orders for advertising.

We make it a practice not to discuss the merits or demerits of other export trade papers. Comments on their value may be made with more propriety by those advertisers who have had experience in the use of such publications.

We illustrate herewith a Convenient Arrangement for the Baker's Workshop.

The machine at the left is our No. 2 Dough Brake, the next our 1½-barrel Dough Mixer, and on the extreme right our 7½-H. P. Gas Engine. The cost of this outfit, including pulleys, shafting and freight f. o. b. New York, boxed, is \$686.00 (£140).

The floor space is 18x6 feet.

Net weight of engine, 2568 pounds; gross weight, 3070 pounds; box dimensions, 46x66x45 inches.

Net weight of dough brake, 667 pounds; gross weight, 967 pounds; box dimensions, 31x48x50 inches.

Net weight of mixer, 1368 pounds; gross weight, 1675 pounds; box dimensions, 76x36x52 inches.

WRITE TO US FOR FULL PARTICULARS AND PRICES ON LARGER SIZES.

THE J. W. RUGER MFG. CO.,
BUFFALO, N. Y., U. S. A.

FRANK MILLER'S HARNESS OIL.

Preserves and softens the leather, thus adding life.
The highest quality of oil on the market.

FRANK MILLER'S Harness Dressing.

Recognized as

"THE STANDARD."

Produces a brilliant jet-black gloss, which will not peel or smut, and to which dirt will not stick.

ESTABLISHED 1838.

The Frank Miller Co.

349 & 351 West 26th Street, New York,

U. S. A.

MANUFACTURERS OF

Blackings and Leather Dressings.

The goods mentioned are but a few of our many preparations for leather. Write to any New York Export Commission House for our Complete Price List and Samples.

**Our Preparations Are Uniform in Quality and
Always Give Perfect Satisfaction.**

FRANK MILLER'S CROWN

SHOE DRESSING.

For Ladies' and Children's Black Shoes. Produces a perfect finish, without injury to the finest leather. Each bottle in handsome carton.

FRANK MILLER'S MEDIUM Finishing Dressing.

For use of Boot and Shoe Manufacturers in finishing new stock, also for restoring old stock to its original fresh and new appearance.

Softens and Preserves.
Prevents Mould.
Does Not Scale Off.

Hook's "Rapid" Painting Machine

Does the work of fifteen men with brushes,
and does it better. Thousands in use.

Hook's No. 10 "Rapid" Painting Machine consists of a special brass liquid and air pump attached to a heavy ALUMINIZED iron tank, and equipped with ten feet of hose, extension pipe (for reaching overhead work without the use of scaffolds or ladders) and special painting nozzle.

It will save its cost in painting 5000 sq. ft. of surface.
Will spread any liquid of a sprayable nature.

SPECIAL OFFERS FOR EXPORT ONLY:

Upon receipt of TEN DOLLARS we will box and deliver f. o. b. cars at New York City ONE No. 10 "RAPID" PAINTING MACHINE, complete; gross weight, 40 lbs.; box, 12½x12½x36 inches; or,

Upon receipt of SIXTY DOLLARS we will box and deliver f. o. b. cars at London, England, SIX OF THE No. 10 "RAPID" PAINTING MACHINES, complete.

Equally low prices to other foreign ports. Remittances to be in U. S. gold or its equivalent.

We refer to 30,000 satisfied users of our machines.

The "Stay-There" Ready-Mixed Cold Water Paint

is composed of minerals ground in a liquid chemical, to be thinned with water. Packed in tight, iron-hooped barrels. IT IS AS DURABLE AS OIL PAINT; will not chalk or peel off; is fireproof, waterproof, washable and sanitary.

Upon receipt of SIX DOLLARS we will deliver f. o. b. cars at New York City ONE HUNDRED GALLONS of WHITE "STAY-THERE" PASTE PAINT. Gross weight, 400 lbs.; barrel, 28x28x20½ inches.

Our 1904 Catalogue, illustrating and describing the largest line of Painting Machines for every purpose, and the "Stay-There" Paint, will be mailed free to any part of the world. We will open accounts with responsible importers furnishing American references. Orders accepted through New York commission houses.

Rice and Coffee Hulling Machinery

Improved Rice Huller and Polisher.

OUR RICE HULLER

Is the only machine that will take rough rice and in one operation make it merchantable. For simplicity, durability and economy has no equal. They are used on plantations, and also in the largest mills. Both the Coffee and Rice Hullers are made of iron and steel, and can be knocked down and packed for mule transportation if desired.

OUR COFFEE HULLER

Will hull pulped or cherry coffee without breaking or leaving unhulled a single grain. The products will come out clean, polished and free from hulls, ready for bagging, all in one operation. It is the **Only** machine that will grind the hulls fine, so that they may be sucked by the blower through the screen underneath the machine, leaving every grain of coffee inside of the machine, no matter how small it may be.

Latest Engelberg Coffee Huller.

SEND FOR CIRCULAR OF OUR NEW MACHINES, WITH PRICES AND ALL INFORMATION.

THE ENGELBERG HULLER COMPANY, P. O. Box B,
Syracuse, N. Y., U. S. A.
Export Office: 339 Produce Exchange, New York City.

LUNKENHEIMER "DURO" BLOW-OFF VALVE.

A valve with self-cleansing seat, simple and practical in construction and entirely different from all other blow-off valves in the market.

The way the "Duro" is built no scale or sediment can lodge on the seat. If you want a practical success and a Valve that will last as long as the boiler, you want the "Duro." No boiler should be without one.

Made in screw ends, flange ends and screw and flange ends, in 1¼, 1½, 2, 2½ and 3 inch sizes. Every valve rigidly tested and inspected before shipment. Specify the "Duro" and order from any leading export house.

Write for Catalog of Brass and Iron Steam Specialties and Engineering Appliances of Superior Quality.

NEW YORK SALESROOM: 96 CHAMBERS STREET.

DIETZ Nos. 30 and 60 TUBULAR SEARCH LIGHTS.

These lamps are made for outdoor or indoor use. They give a powerful and brilliant light, and are not affected by the wind.

They are suitable for use in mills, workshops, warehouses, stables and summer resorts, or in any other place where a good light is required which will not be affected by strong breezes.

Where it is desired to light up a long row of animals or a long, narrow room of any kind, these lamps are especially desirable.

No. 30 is fitted with our patent bull's-eye lens on perforated plate, adding to the appearance of the light.

No. 30 has a blizzard globe, 1-inch wick and a bright tin reflector 12 inches in diameter. Price, \$30.00 dozen.

No. 60 has a No. 2 globe, 1 1/4-inch wick and a bright tin reflector 16 inches in diameter. Price, \$72.00 dozen.

We are pleased to send complete catalogues (Spanish or English) and price list to those interested.

OCEAN WAVE WASHERS

Wash the clothes as easily and cleanly as sea waves wash the beach.

OVER 100,000 NOW IN USE.

Shipping weight, 85 lbs.

Size, 2 x 2 x 3—12 cubic feet.

SPECIAL FEATURES.

Our Gearing: Simple in construction; impossible to throw out of gear; the longer it is used the easier it will run. Our Fly Wheel has no threads to strip; no nuts to lose, being attached or detached in a moment's time. Our Improved Dasher is hand-turned; clothes do not cling to it and tear. We assure free action of dasher by using heavy galvanized flanged ring in dasher block, thereby relieving all friction. In general construction of tub and finish, only best materials are used. We ship through any responsible New York exporter. All orders must be sent to us direct.

THERE IS NO FRICTION.
NO LOST MOTION.

"The White Lily Washers, Wash Lily White."

Such is the verdict of thousands of users throughout the "States" of the

WHITE LILY WASHER.
WASHES LILY WHITE.

White Lily Washer.

The White Lily (Rotary) Washer is made from Louisiana and Mississippi Red Cypress, which is less susceptible to expansion and contraction caused by hot or cold water than any other timber known. Our hinges are put on with bolts instead of screws, and every part is reinforced wherever necessary, thus making the

Most Durable Washing Machine Made.

By the use of a HIGH-SPEED ROTARY WASHING MACHINE you can create a soap-suds or foam without having to turn the fly-wheel so fast that the SPEED, rather than the work, tires the operator.

The speed of the White Lily Washer is 2 3/4 turns of the fly-wheel to one turn and return of the dasher. The White Lily Washer is the Highest-Speed Rotary Washing Machine made. Will create more soap-suds with less exertion, and will wash clothes cleaner than any other known washing machine.

Special Offer to Introduce Abroad:

Upon receipt of **Thirty dollars** (\$30.00) in U. S. gold or its equivalent we will box, ready for transportation abroad and delivered F. O. B. cars at New York City, **Six (6) White Lily Washing Machines.**

Weight, 600 lbs. Measurements: 18x24x24 inches.

WHY OUR GOODS SELL WELL.

THERE are many reasons why the export trade of the United States is increasing. Excellence of our manufactures is an important element in the growth of this branch of the country's trade, but the question of price also enters into the matter of expanding trade to a more material degree than is appreciated by our esteemed contemporaries of the daily press, both in America and abroad. The editors of these publications are prone to jump at conclusions and rarely analyze facts or seek reasons for their statements. Men who closely watch the trend of trade can supply the keynote to the great gains in our export sales in the sentence: "The days of high prices and great profits are gone." There was a time in America not so many generations ago when short-sighted men engaged in manufacturing would rather sell one article at a profit of \$100 than sell ten articles at a profit of \$10 each, although the total would be the same—\$100.

Men of that description have long since been relegated to the ranks of star performers in the bankruptcy courts. Their doom was forecast when there came into the mercantile world a class of men who were contented with moderate profits. Some of them figured that 10 per cent. net profit was enough. On that basis their prices were so much lower than their old-style rivals' that the public at first was distrustful, and it was harder to sell at the lower price than at the higher price to larger customers who wanted quality as well as cheapness. It was difficult to break the ice, but when the moderate-profit skaters had been at work for a time the surface of the smooth ice-covered pond of enormous individual profits melted away more quickly than does an iceberg under an equatorial sun.

The old-school manufacturers were without the large plants that were necessary to meet the terms of their new competitors who had made preparations to manufacture the larger quantities of goods at the lower prices and lesser individual profits. The evolution in some lines of industry occupied little time; in others prestige and good-will prevented an immediate adjustment of conditions, and in isolated cases the balance did not come for several years; but, like all of Nature's laws, this one of supply and demand, as between large and small profits, eventually adjusted business so as to conform to the new conditions. This readjustment has long since gone into full force and effect. The 10 per cent. basis has been cut practically to a 5 or 6 per cent. basis. American purchasers are getting the benefit of the reduction. Foreign purchasers also are able to buy our goods at the lower rates, and they are getting better articles at the lower prices, for improved methods of manufacturers have lowered prices without cheapening the quality of the products, so that the present-day American goods, whether sold at home or abroad, are of superior value and very much less costly than they were before the country took on

its present forceful and irresistible impetus which puts it in the foremost rank among the Powers of the world, in commerce, in war, in peace, in everything that may be for the good of the whole world. Selfishness is *not* an American characteristic. "Live and let live" is an old saying which Americans like to think is as much appreciated in other quarters of the globe as it is on the North American continent. The development of the world offers opportunities for the merchants of all nations. Our own merchants have no desire to secure more than their fair share of the globe's commerce. They are getting it now and their policy of good goods and reasonable prices is the chief reason for the rapid growth of both our domestic and our export trade.

AMERICA'S EXPANSION.

THE present executive government of the United States is founded upon the principle of expansion, which includes retention of the Philippines, although the basis of the existence of the Union was confined to a comparatively small portion of North America. The republic grew until it occupied a wide belt across the continent from the Atlantic to the Pacific Ocean. It was a long time before the Philippines became our colonies, and the acquisition was the ultimate result of accident, when traced directly to its source. The citizens of this country are disposed to permit the wisdom of future administrations to govern not only their own territory, but to decide the ultimate fate of the territories beyond the seas. The Philippines are American possessions "until the Filipinos can govern themselves"—whenever that may happen—and it seems a long time away, judging by Spain's experience and our own. The archipelago is an important commercial point in the Far East, and its future is an interesting problem. The subject comes up in interesting form in a speech recently made by United States Senator Proctor, which will interest the citizens of other countries than our own:

"The government of a people or country by another people or country not contiguous is at the best experimental and temporary. Such a condition may last a long time, but it cannot be permanent. With training and development it is the God-given human nature of all people to wish to govern themselves, and not owe allegiance across the sea. We shall make some mistakes, for we are human, but I believe we shall so carry ourselves that the world will be better for our having assumed these colonial responsibilities. Go slow should be, and I believe will be, our policy in the new field. If I could make the future geography of the American Union I might be a little uncertain about the northern boundary—whether to make it Canada or the Arctic Ocean; preferably the latter in God's good time. Franklin said in 1783 it must come some time, and he was a wise man. But the other lines would be fixed—East by the Atlantic, West by the Pacific and South by the Republic of Mexico and the Gulf. And within these boundaries may the future government of our country remain, its executive, legislative and judiciary and the voting population that makes that government."

Senator Proctor is an eminent statesman, and his opinion on any subject is valuable, but he is not likely to succeed in doing anything to retard the spread of American commerce, nor is he to be suspected of such an intention. We quote what he says chiefly because there is a chord in his peroration that will interest thousands of readers of THE AMERICAN EXPORTER in a sympathetic and sentimental way.

REPORTS are again conflicting as we close this issue of THE AMERICAN EXPORTER, regarding the outcome of the dispute between Russia and Japan. The feeling here is that the difficulty will be adjusted without war, although it must be confessed that some of the reports are of an alarming tenor.

CONSULAR reports from Germany indicate that the crisis in industrial values in that country has apparently subsided, and that the general recovery has every outward indication of being permanent. The effect will unquestionably be beneficial to American trade with Germany.

SOUTH AFRICA'S FUTURE.

FOR no section of the globe does the new year hold out brighter hopes than for South Africa. Recovering not so recently from an ugly war, which paralyzed its industries and closed its mines, the country has taken on a new era of industrial prosperity. The Boer war has been a blessing in disguise, perhaps. Until the war occurred South Africa was chiefly noted for her diamond mines and her broad expanses of grazing land. Her agriculture, as we understand it in the United States, was chiefly remarkable for its paucity. Agricultural implements of modern make were used by few of the farmers, and practically no attempt was made to obtain from the fertile country the dividends of produce that Nature was only too anxious to declare. The war sent into the country new men, fighters in peace when war was no more—men who knew things, men who were anxious to accomplish something, men who would just as soon raise a finer field of wheat than their neighbors if there was no other way of showing their superiority. Some of these newcomers were men who believed in iron and steel; if they could not have the metal in cannons and rifles, would use it in agricultural machinery. An old correspondent of *THE AMERICAN EXPORTER*, writing to us recently, declares that he can hardly realize the extent of the revolution that has followed the war. New men, new methods and improved machinery have given an impetus to the country that seems to him to be "almost unreal." Our correspondent encloses an editorial printed in *Industries*, a Durban newspaper, from which the following extracts are printed, as marked by our correspondent:

"As the Chinese labor question may be now considered practically settled, we can, therefore, turn our thoughts in another direction, and consider the best method of restoring—in fact, creating—the future prosperity of South Africa. For apart from gold and diamonds, South Africa has not yet produced anything of note worthy of the name of exports. It has been virtually a land of samples in the past, a little wool, wine, hides and coal, nothing else of importance, save perhaps ostrich feathers. We have, in fact, to look to entire strangers for part of our daily bread—we are, indeed, very young. Now, all this comes of depending so much on gold and diamonds, and it is very evident South Africa cannot live on the proceeds of these precious metals alone; she must have something more abiding and more substantial on which to rear her young progeny. We have the land, as fertile land as in any other part of the globe; we have the water running naturally in many places, and capable of being conserved in dams, where it does not already occur in rivers and lakes; we have an equable climate, suitable for the cultivation of all kinds of crops, from wheat, potatoes and mealies, to grapes, oranges and pomegranates. In short, all nature is smiling, 'every prospect pleases, and only man is vile' in his inherent idleness and indolence.

"One can pity the poor native because he knows no better than to bask in the sun, and expect his better-half to do all there is to be done in the shape of labor; one can also understand the past indifference of the Dutch population—the pioneers of the vast sub-Continent—who simply led a pastoral life dependent on the increase of their flocks and herds, in the days gone by; but we have no sympathy with our own countrymen, who came to South Africa, found it a howling wilderness, an uncultivated expanse of beautiful country, a land flowing with milk and honey, corn and wine in prospective, and are content to leave it so, merely rushing after the gold and diamonds and precious metals, and utterly neglecting these weightier matters of the law of life."

Industries goes on to detail the changes that have occurred, and points out the fact that the new order of things is increasing the demand for agricultural machinery. Its editor believes that real prosperity has come at last to the lower portion of the Dark Continent, and from all reports that we have lately received he is undoubtedly correct; but it must not be forgotten that American manufacturers of agricultural implements can make substantial claim to a considerable portion of the credit for South Africa's improved condition since the war, and it is certain that they will have much to do with the country's future prosperity. As in other fields, American enterprise is much in evidence in South Africa.

OUR CONSULAR SERVICE.

THE National Business League, of Chicago, U. S. A., is prosecuting a vigorous campaign for a reorganization of the consular service of the United States, supporting Senator Lodge's bill, or a measure based on similar lines. The chief points of the Lodge bill are given below, as they are of general interest to our foreign readers who come in contact with the official representatives of our Government, and as they show the tendency of American sentiment in promoting amicable trade and other relations with the inhabitants of the remainder of the earth:

1. Abolishment of fees as compensation to consuls, except as to consular agents, and the substitution of fixed salaries.
2. Improved classification of consular officers.
3. Adoption of the "merit system" in the selection of consuls.
4. Consuls must be familiar with either the French, German or Spanish, as well as the English, language, possess a knowledge of the commercial resources and requirements of the United States and the countries to which they are accredited.
5. Consuls shall be eligible for promotion.
6. Tenure of office to continue only during efficiency and conduct of the highest grade.

The Lodge bill has our hearty and unqualified approval. Its tendency is to place our consular service upon an improved and a higher basis than it is at present, although it is now wonderfully efficient and is doing a vast amount of good for the country and its merchants. In recent years the political element has been minimized in its influence, but it is true that some incumbents have managed to evade the restrictions which custom now throws around these appointments. Some of our consuls are underpaid, considering the great interest they take in their duties. Others, perhaps, may be overpaid, but we doubt if any official in the United States consular service is derelict in the important duty of giving his best energies to the advancement of our trade and commerce. There may be exceptions where the official does not direct his efforts as intelligently and efficiently as the majority, but on the whole it is a marvelously efficient machine of the Government. In the proposed reorganization we cannot see how anybody will suffer, except, perhaps, the one or two or three who may be exceptions to the general rule. Even in their cases, if they take advantage of the exploitation of public sentiment, they may survive and become more useful members of the corps.

Our acquaintance with the consular representatives of the United States extends over a quarter of a century, and we doubt if any country has ever had a more generally capable lot of foreign representatives. The consular service of other countries has improved as years have passed, but the American seems also always to have been getting better. The reorganization will make the service more useful than ever before, for it will place the present capable officials upon a civil service basis, and will benefit them otherwise in many ways. In this connection we think it proper to say that in our efforts to advance American commerce abroad we have always had the hearty support of the official commercial representatives of our Government, and we feel deeply indebted to them for their courteous and painstaking action upon requests which have often required considerable labor and trouble, without much more than the knowledge of appreciation and a sense of a conscientious fulfilment of duty to reward them. We sincerely hope that the Congress will see the consular service measure in the same light that it is viewed by the manufacturers engaged in the export trade and by ourselves, and place the corps upon a better and more satisfactory basis.

THE agitation by Mr. Chamberlain in favor of preferential treatment of the industries of the British Empire is beginning to have its effect, according to recent cable advices. A recent case in point is the acceptance by the Corporation of Swansea of a British tender for the extension of the tramway system involving an expense of £103,000, although a German company offered to do the work for £2,000 less. Other preferences of the same sort are reported, but so far as we have heard the American trade with Great Britain has not been affected.

THE LIGHT OF THE FUTURE.

IT is within the memory of men who are not yet aged that wax and tallow candles were universally used for illumination. The brighter gaslight and kerosene lamps came afterward and sounded the doom that has since come to the candles, except in localities where there were so few inhabitants that gas could not be produced with commercial propriety. Next came the electric light, first in crude form, but now in such perfected state that it is better and cheaper than gas. In modern American cities gas is becoming more and more of use only as fuel, for the electric light is more satisfactory, and in many cities less costly by comparison. Business men have long used electricity for illumination, but it is only comparatively recently that families in dwellings have been permitted to enjoy the advantages of the new system. In some American cities the introduction of the new method of lighting has been carried to the same extent that gas is supplied, and we have in mind a case that indicates the progress made in this direction.

A family living in an American city in the thirty days ending in the middle of January, 1903, paid a gas bill amounting to \$9.30, the gas being used for illumination and cooking. In the corresponding period, in 1904, the same family paid \$5.40 for both electricity and gas, using the former for lighting and the latter both for cooking and partial illumination, supplementary to the electric light. The gas was sold at \$1 per 1,000 feet. The electric light was used freely, incandescent bulbs of 16 and 32 candle-power being part of the equipment. The illumination was 200 per cent. better and the expense was in inverse ratio.

The advances made in electric lighting are marvelous when a person pauses for a moment to think upon the history of the discovery and the advances that have been made in its development. As seen in some American cities this method of lighting has well-nigh reached the limit of adaptability from every point of view. What, then, have we to expect in the future? As gas supplanted the candle, as electric lights are superseding gas, may we not expect some new form of illumination more brilliant than even the present form of lighting? Where will it come from? Who will invent it? What will it be like? Those who study the world's progress in these years of wonders feel that it will come, in fact, that it must come. They do not like to speculate upon the subject—it is too vague, too problematical.

On another page we print an account taken from a contemporary regarding experiments made in the city of Philadelphia in the matter of radiation of light from the human body and the possibility of using it in the manner that X-rays have been used to make photographs. It is an attractive subject for discussion, but we shrink from saying more about its possibilities than that its realization might seem to be no more wonderful than thousands of emanations from the brain which guides the actions of the human body and perhaps no more astonishing than electric lights would be to our forefathers if they could return to note the great changes that have been made for utility and comfort in the world since they ceased to share in its sorrows and its joys.

Thomas A. Edison, the wizard of Menlo Park, whose electric inventions have astonished the world and who has done more than any other man to put electricity upon a commercial basis, may be the father of the new light. In saying so we do not ignore the important achievement of Peter Cooper Hewitt in discovering his now famous vacuum light, nor do we forget the equally valuable researches of Charles P. Steinmetz, both Americans, who have apparently succeeded in eliminating the injurious rays from the electric light. Up to the present time these lights have not made much progress in supplanting ordinary electricity, nor can they do so where colors must be distinguished, as we understand the situation. We are not discrediting either Mr. Hewitt or Mr. Steinmetz in what we say, but we doubt if their discoveries will ever fully supplant the present commercial electric light. Both will be found useful for many purposes, but neither is likely to be the light of the future. Either of these inventors may discover something new and marvelous. It is believed, however, that Mr. Edison is now doing more discovering in that line. Recently when asked

by the editor of THE AMERICAN EXPORTER for his opinion upon the subject of light, he wrote tersely and epigrammatically a note not intended for publication which seemed to show that he had given the subject consideration.

Mr. Edison is a man of few words, but of many ideas. He is a man of achievements, rather than promises. It is evident that he is at work upon the light of the future, but he is not likely to take anybody into his confidence until he has found a practical solution of what is one of the most fascinating scientific and commercial problems of the twentieth century.

LESSON OF PEARY'S QUEST.

THE quest of the North Pole, so far as we can see at the present time, is of no commercial value, and is only of scientific interest, but it is, nevertheless, a fact that the sentimental feeling of wishing to have an American make the discovery is responsible for a widespread support in this country of the renewed effort which Commander Peary, of the United States Navy, will make to reach the hitherto inaccessible location. Everybody in America wants Commander Peary to find the North Pole, but not a soul has yet suggested what he shall do with it when he makes the capture. Perhaps he can cut it down, as if it were a tree, and exhibit it at some world's fair, but, levity aside, the chief deduction to be derived from the enthusiasm Peary arouses is the knowledge that his support comes largely from persons who are enthusiastically in favor of making progress that will benefit America and the remainder of the world, even if the results are only scientific and not tangible from a commercial point of observation. Our esteemed contemporary, the *Chicago Inter-Ocean*, says:

"Everybody will be glad if Commander Peary's next dash to the North is successful. We all want him to capture the prize, and, of course, we want him to capture it in the name of the United States. Scientifically speaking, the capture of the pole will be one of the greatest achievements of the age, and it would be a shame if any other nation should capture it first; but once captured it will be, commercially speaking, a weight on our hands. If it were closer to our throbbing heart of industry we might use it in our business, but there are insurmountable difficulties in the way of utilizing it as a refrigerating plant, at least until our territory and our trade shall expand to such an extent that we shall be compelled to establish reserve stock cold-storage warehouses within the arctic circle."

It is interesting in this connection to recall that in his lecture before the Royal Geographical Society, in London, in November last, Commander Peary spoke of the North Pole as the northern zenith of the nation's destiny and the Panama Canal as the southern boundary. No such restrictions can be placed upon the extent of American influence. Since the arctic explorer delivered his address important developments have occurred in the South, and in the language of the sage of Barneget Bay, "it is up to" Commander Peary to make the North Pole as much of a reality as American diplomacy has insured the immediate construction of the great waterway that will soon connect the Atlantic and the Pacific oceans through the center of the western hemisphere.

TRADE follows the flag, say the believers of expansion in every government, and to a considerable extent the axiom is true. We are surprised, however, to learn from the *Petit Parisien* that although Russia and France have enjoyed the closest diplomatic relations the trade between the two countries has been in inverse ratio. The *Petit Parisien* points out that the exchange of produce between the two countries barely exceeds \$50,000,000 a year, against \$200,000,000 between Germany and Russia, and \$120,000,000 a year between Great Britain and Russia. But more than this, it is stated that France sells her ally only a quarter as much as she buys of her. Our Paris contemporary is much concerned about the discrepancy, but in America we are not worried about it, for both the French and Russians are showing an increased appreciation of the worth of the goods we have to sell to them.

KING SEES AMERICAN WORTH.

WHILE little commercial significance can be attached to the fact, it is worth mentioning that the King of Italy has recognized and honored American journalism by making Col. Melville E. Stone, of New York, a grand commander of the Order of St. Maurice and Lazarus. This elevates Colonel Stone to the rank of a knight, and confers upon him the title of Sir. Sir Melville E. Stone is practically the head of the Associated Press in America and has reduced news-gathering to a systematic and business basis, covering the entire globe. The American Associated Press is an important element in the world's progress. The men at the head of it recognize that trade and commerce are great factors in international relations, and more than ever before have they given careful attention to this phase of human activity since Colonel Stone has been the chief directing agent of the great institution. The recognition which Colonel Stone receives from the King of Italy is doubtless a very pleasant personal compliment to the active and forceful manager of the Associated Press, but it is no less a recognition of the wonderful progress that has been made in the newspaper industry in the New World.

Our foreign readers may wonder that Colonel Stone should be honored in this way. For their benefit it may be said that he occupies a position which in a business way can be compared only to that which the President of the United States occupies in a political sense. In an executive way the two positions are very much alike. The President administers the affairs of the nation as a whole, but he has no power of interference with the domestic affairs of the several States which form the Union, so far as they do not violate national laws enacted by the Congress. The general manager of the Associated Press in the same way supervises the news-gathering of the entire country, and his association furnishes thousands of daily newspapers with the news of the events that are happening not only at home, but abroad. Like the President, he has great power, but he cannot interfere with the policy, political or otherwise, of any one of the thousands of papers forming the great press association which he manages. To go further, the President has his ambassadors, consul-generals, consuls and commercial agents at all points where they are needed throughout the world, and the general manager of the Associated Press has his correspondents at the same points. As to various details which would not interest our readers, the comparison could be carried much further.

All of the great newspapers of America, with a single exception, are members of the Associated Press, so that the responsibility of seeing that they are properly served with news is a very serious matter. There are about 8,000 newspapers that depend in a major or minor degree on the Associated Press for news. Many of them supplement the service with the news that their own correspondents secure and the many other sources of information which are open to enterprising American publishers are not neglected, the latter including the Publishers' Press Association and the New York *Sun's* telegraph news bureau, both of which are important elements in American newspaperdom. Our purpose at this time is not to give a directory of press associations, nor to make comparisons, but rather to point out the progress made by the Associated Press under Colonel Stone. There was a time when the change in the management of a big railroad, the exportation of an important consignment to Australia, the state of trade in Great Britain, a fresh discovery of chemical and commercial value in Germany would have received scant attention, while some piece of criminal news of no worth in making the world better would be given undue prominence. Colonel Stone has not entirely cut out the bad features of life everywhere, but he has so managed his service that the good receives its full fair share of attention. The murder stories sent over the wires are shorter; the accounts of events that will be of benefit to mankind are longer, better and more comprehensive than ever before. Considering the vast and complicated machinery under his direction, Colonel Stone is entitled to more honors than the one just given to him by the King of Italy.

It would require more space than we can spare to print more than a hint of the wonderful progress made by American newspapers. Some rough idea may be acquired by the statement made on the authority of a prominent telegraph official that American newspapers, taken altogether, spend very close to two million dollars a week for telegraph and cable tolls.

EDUCATION AND PATRIOTISM.

THE New York *Evening Post* prints some interesting observations in connection with the recent visit of British experts to study our educational system, which is unquestionably one of the chief factors in American progress. In America absolute perfection is not claimed for everybody and everything. If that state were reached there would be nothing more to be done. The *Post* in its comments strikes a vein that is of human as well as of commercial interest, for the thought applies to grown people as well as to children. There is a frankness about the observations of the editor of the *Post* that is both naive and characteristic. He says:

"We and our visitors, however, often forget that the success of the American schools is due less to mere machinery than to the temper of the common people and the spirit of our Government. Some of the most highly cultivated men whom America has produced have graduated from the little crossroads district school, taught by young men who had mastered nothing more than the three Rs, or from colleges whose equipment half a century ago would to-day be regarded as inadequate for a village high school. The truth is that our population justly holds knowledge to be power, and is bound to get an education, with good schools or without them.

"The schools are far from perfect; they are, as President Eliot and others have pointed out, often wasteful and mechanical. We put huge classes through all grades at the pace of the slowest third, with little provision for developing and advancing the brighter third, for breaking the lockstep. Our grammar and high school masters are, as a class, men somewhat lacking in ambition and energy. These and other faults are apparent on the surface. But were our schools much inferior our boys would still crowd ahead and make their way.

"The real underlying cause is our free institutions. To say this is to seem guilty of Fourth of July rhetoric, of making the eagle scream; but exaggeration is scarcely possible in describing the stimulus of liberty. Americans who have lived more in Europe than at home talk languidly about the failure of democratic government. But no man who has seen that line of State universities—Michigan, Wisconsin, Nebraska and so on to California—no man who has heard the surge of our Western beaches, can deny that the same spirit of liberty which was displayed in the Revolution is the most potent factor in American progress to-day. The prospect of mounting from the very gutter to the proudest place in the professions, in politics, in literature, has fired every boy and girl who has a spark of ambition, and has made our schools, though deficient at many points, the best in the world, because they are the visible sign and opportunity of the 'career open to talent.'"

The editor of the *Post* might have added some comment in line with a recent editorial in THE AMERICAN EXPORTER, when we wrote about the spirit and ambition which actuate the average young American in excelling in practical mechanics, but the general tenor of the editorial is so truly American that for only American readers it might have been superfluous to have said more than we have quoted.

RATIFICATION of the new treaty with China was an important event of the month just closed. The President of the United States has acted with his usual promptness in naming consuls for the Manchurian posts and the men he has named are particularly well fitted for the duties which they will have to perform.

THE Colombian excitement over the Panama Canal seems to be subsiding, and it is only a question of a short time before the little republic will cease to worry its new sister of Central America.

BATTLE OF GIANT FORCES.

Crucial Tests in Progress Between the New "Prime Mover" and the Reciprocating Engine.

FOLLOWING up the particulars published in THE AMERICAN EXPORTER regarding the Cunard Steamship Company's duty tests to show the relative value of turbine and reciprocating steam engines, a writer in the New York *Herald* has gathered some additional information of interest to everybody who uses steam for power purposes. The writer says: "The remarkable interest manifested at this time is due to three recent developments involving the turbine type of prime mover, but all of which are, curiously enough, commercial rather than mechanical."

The first of the series of events to claim attention was the organization of a number of British experts who formed the Cunard Turbine Commission, the object of which was to determine the economy and endurance of the new system when compared with the reciprocating engine. The commission has just now entered upon its final duties, and is making exhaustive tests with the new mode of marine propulsion.

Next to this the importance and far-reaching utility of the turbine was again brought out vividly when the award was made by the New York Central Railroad to the General Electric Company for a complete turbine equipment with which to operate the electric generators employed in the traction system through the tunnel and on the Mott Haven division in New York City. The third instance was the announcement that the Westinghouse Company has acquired the rights to manufacture in the United States and Canada the Parsons steam turbine.

To return to the Cunard Turbine Commission and its tests for securing data upon which to base its findings, favorable or derogatory, as the case may be, it was necessary for it to obtain two vessels, one equipped with reciprocating engines and the other with steam turbines, but in all other respects the two steamships would have to be practically alike.

These specific requirements were due to the fact that with steamships there is no measurable amount of work done, as there is in generating electricity, and so a relative comparison of steam consumption in propelling both types of ships at the same speed and equal draught displacements becomes necessary. The commissioners were enabled to obtain two ideal vessels of the opposite types, built by William Denny & Bros., the shipbuilders of Dumbarton, who placed at their disposal the *Arundel*, a twin-screw steamship, and the *Brighton*, a turbine steamship.

These vessels are regarded by their makers as perfect representatives of their respective types, and were constructed after models which were experimented with in the company's tanks. This was done with a view of obtaining the maximum economy of propulsion with the minimum dimensions, and the ships differ from each other only in details of construction, in order that the varying conditions imposed might be fulfilled in the most practical manner.

In the *Brighton* the propelling machinery consists of three sets of turbines, manufactured by the Parsons Marine Steam Turbine Company, supplied with steam from boilers of the Scotch type. The arrangement of the turbines is three shafts with five propellers, the center shaft being fitted with one propeller and the two side shafts with two propellers each. When maneuvering the vessel the center shaft runs free and the two side shafts take the place of the ordinary twin screws, and, as has been demonstrated, the power of maneuvering is in every respect as good as in ordinary twin screws, while in going astern there is none of that objectionable vibration which is felt even in the most modern twin-screw arrangement.

The *Arundel*, on the other hand, is fitted with balanced twin triple expansion engines of the reciprocating type of the most improved design and of such size as to practically consume all the steam the existing boilers can make, so that her displacement is slightly increased by carrying the extra weight entailed by the heavier triple engines, as compared with turbines.

The *Herald* writer further says that the American inventor of the turbines used in the new type of vessels has given some interesting data relating to the economy of turbines at low powers. In this the reciprocating engine has its sole advantage—it may run as slowly as desired, with a minimum sacrifice of economy. The Clyde steamships for carrying passengers are always run at or near full power, and so there is no need to study the question of economy at low powers, but when their application was considered in reference to war vessels, most of whose service was performed at cruising speed, when the power exerted was perhaps only one-tenth of that at full speed, then this question of economy at lower powers became one of vital importance.

Arrangements have already been made to solve this difficult problem in several different ways. For instance, the turbine equipment of a war vessel might be made up of a number of small units, and Mr. Parsons is of the opinion that by this and other means turbines may be operated as economically—probably much more economically—than ordinary reciprocating engines at the same low power, while at high speed the turbines would have an advantage of from 20 to 40 per cent.

While the Cunard commission was doing its work in England a board of experts had been appointed by the Government of this country to determine the efficiency of the steam turbine for the navy. The former commission is still at work, while the home board has already sent in its recommendations. Both the Parsons and Curtis turbines were thoroughly investigated, and, while the report was favorable to the new engine, their conclusions were diplo-

matically stated in their reports and merely prescribed a trial of the turbine on a limited number of vessels.

Up to the present time, says the *Herald*, the United States has led the world in the utilization of the turbine for stationary power plants, and England has been in the lead in the application of turbines to the marine service; now it has taken another initiative and is equipping a torpedo boat—the *Amethyst*—with turbines capable of developing 9,800 horse-power.

Mr. Westinghouse, whose company controls the marine, as well as the stationary turbine rights to manufacture the Parsons invention in this country, recently said that a great marine turbine industry would be built up in the United States for all classes of ships.

The only field where it is likely the steam turbine will not directly succeed the reciprocating engine is on the railroad, but electric motors operated by stationary turbo-generators are so rapidly taking the place of steam locomotives that in another generation the last railroad engine may be coveted by the British Museum, to take its place by the side of Stephenson's famous old Rocket.

The New Treaty with China.

THE commercial treaty signed last month by and between the United States and China was an important step on the part of both nations toward expanding commerce in the Far East. The treaty had been hanging fire for so long a time that when the ratifications were made there was more or less of a surprise in diplomatic and commercial circles. The treaty provides among other things for the opening to foreign trade of the Manchurian ports of Mukden and An-tung, and it went into full force and effect on January 13th through its promulgation by President Roosevelt, following a quickly arranged exchange of ratifications at the State Department.

The assurances given by Russia that she would respect the interests of foreign nations in Manchuria make stronger the position of the United States, but there was a feeling here that had war been begun between Russia and Japan before the new treaty went into effect it might have been contended by Russia that her assurances applied only to such agreements with respect to Manchuria as were in operation before hostilities began. The American Government was, therefore, very much relieved to have been able to make the treaty with China operative last month.

The treaty has been nearly a year and a half in negotiation. It principally relates to commerce and navigation, but it covers several other important subjects. The provision which opens two new localities in Manchuria to foreign trade is of the more interest. American consuls have already been appointed, and other nations will take advantage of the situation to send their representatives to the two ports—An-tung and Ta-tung Kou. It all means an increase of commerce in the Far East.

Commercialism of the Right Kind.

OSCAR S. STRAUS, president of the New York Board of Trade, at its banquet last week in New York City, said some things that are worth repeating: "There never was a time in the history of any nation when a larger responsibility and a larger duty rested upon those who are engaged in commercial pursuits than in this the opening of the twentieth century, in this age and in this the country of commercial expansion and industrial development. And, thank God, there never was a people better equipped to carry forward this development in consonance with the broad and liberal spirit of human welfare and international good-will."

"We are proud to be a commercial nation and to carry the banner of that noble form of commercialism that stands for the spirit of mutuality and for human welfare, that blesses the nations that send and that receive the products of our fields, factories and furnace, our locomotives, our sewing-machines and our grain."

"A commercialism that stands for the open door in China and for an open canal at Panama, which shall lessen by thousands of miles the distance between the great commerce-bearing oceans; a commercialism that seeks its triumphs not at the cannon's mouth, but along the highways of peace, through a world-wide expansion of a world-blessing commerce."

Mr. Straus is a prominent business man of New York City and was appointed United States Minister to Turkey in 1887, serving for a long time thereafter. His interest in our expansion of trade abroad makes his utterances of interest as coming from a patriotic American.

New Use for Gas Engines.—The city of Philadelphia, U. S. A., has recently established a \$250,000 pump house near the center of the city, the idea being to supply increased water pressure during fires. The pumps will replace forty steam fire engines and will reduce insurance rates 25 cents for \$100. The selection of gas engines for motive power is novel, but is believed to be justified in view of the perfection of the modern gas engine, as regards reliability and freedom from break-down. The great advantage incident to the use of gas and hot-air engines are their economy during periods of idleness, as compared with steam plants, and the ability to start up immediately and at full power.

The Venezuelan Decision.—In our last issue it was stated that the Venezuelan arbitration case was expected to be decided February 1st. The tribunal, however, has postponed action until February 26th.

PHOTOS BY HUMAN X-RAYS.

Development of an American Discovery Which Has Astonished Scientists.

IN a previous issue of THE AMERICAN EXPORTER we made some reference to the discoveries of Dr. Arthur Goodspeed, of the University of Pennsylvania, U. S. A., in the direction of obtaining photographs in a new way. The Brooklyn *Eagle*, which has investigated the matter, makes report of the development of the discovery, substantially as quoted below. The *Eagle* declares that by a series of interesting experiments in secondary radiation, Dr. Goodspeed has established beyond peradventure that nearly all material objects are capable, under certain conditions, of giving off rays of light of their own, and notably that from the human body there may emanate rays of such quality that photographs can be taken by them. Now, this does not mean, as a Philadelphia paper put it, a discovery that will make "every man his own electric light" in future. In the first place, these rays only develop under certain conditions, and in the second place they are rays not of optical, but of physical, light and invisible to the human eye, though capable of making their record on the sensitive film of a photographic plate.

The certain conditions are such as to preclude every man's being his own electric light, even if the rays given off were of visible, optical light. These new rays are only given off by objects that are within the influence of X-rays, and, consequently, in order to develop them every man would have to carry a Crookes tube around with him and all the apparatus necessary to the production of the Roentgen rays. It is not that such bodies develop X-rays of their own, but that being in the path of X-rays develops in them a certain activity which communicates itself to the surrounding ether in new rays of yet other character.

Dr. Goodspeed was the first man in America to experiment with Roentgen rays, though ignorant of the nature of the effect at this time, and he was thoroughly familiar with all the recorded experiments. Summing up, Dr. Goodspeed says:

"It has been shown possible to produce secondary radiograms on a sensitized film, enclosed in a perfectly dark receptacle, by means of absolutely invisible emanations coming from various articles, including the human body, which have been excited by X-rays generated within a black box in a perfectly dark room.

"This apparently startling conclusion loses much of its mystery when we contemplate that it is entirely proved at the present time that only about 2 per cent. of the radiant energy that comes to us from the sun is capable of affecting the human eye. That bodies on the earth, therefore, while bathed in a portion of the other 98 per cent., may be capable of diffusing some of it is what any thoughtful person will admit.

"Naturally, the most favorable place to get some of the 98 per cent. without the visible 2 per cent. is in a dark room. Of course, I use the word 'dark' only as applied to the human eye. It is quite possible—to my mind entirely probable—that a mouse and very likely a cat could, if it had proper intelligence, give us valuable assistance in rooms to us totally dark, which are doubtless to them comfortably illuminated.

"All matter absorbs energy in waves of varying length and gives it off in waves of a different length. The human body gives out the rays or waves of the energy of comparative freedom. Animals may doubtless see a light invisible to man, while in a light in which man sees readily the animal would be blind."

This human light radiated under the influence of X-rays in sufficient intensity to leave its record on a photographic film is under ordinary circumstances invisible to the human eye. Yet Dr. Goodspeed tells in recording one of his experiments how the sensitive screen exposed only to this light became distinctly luminous to his eye when he had looked at it through a brass tube for ten or fifteen minutes until his eye, glued to the end of the tube, had become sufficiently sensitive through the absolute exclusion of all other light. What was visible, however, was a fluorescence produced on the screen by the impact of the secondary radiation upon its surface.

Unique Egg-Hatching Machine.

AMAN engaged in the poultry business in the United States thinks that he comes close to winning a medal for beating the world in his avocation.

Some account of it may interest readers who are not in the poultry business. The man, whose name is W. P. Hall, has just completed his fourth mammoth incubator. Its capacity surpasses anything in the way of an incubator, or "wooden hen," yet built by man. The machine holds 7,500 eggs; it is 51 feet long by 4 feet 4 inches wide; it has fifty compartments, each 25 inches square, and each compartment has two trays. Each tray holds seventy-five eggs.

Most incubators are heated by oil lamps, but this one has a little stove to maintain its temperature at the required point. A hot-water heater stands at one end of the machine; it is about three feet high and burns pea coal. All the attention it requires is a shake and feeding of coal in the morning and evening, for it is so designed that its apparatus regulates the heat sent into the incubator. A throttle arrangement shuts off the fire when it becomes too vigorous, opening the cold air draught at the same time and thus maintaining an even temperature.

Every feature of the hatching process has been carefully studied out by

Mr. Hall, who has gone to the extent of providing for the animal heat generated in the eggs as the fertile eggs start to hatch. As the heat of the pipes is always at the same temperature, if provision were not made to care for the heat of the eggs as the chicks develop the entire hatch might be lost. Mr. Hall has recognized the importance of this matter. In the door of each compartment is a window. It is double glazed and hinged and held in place by a button. The egg trays of the various compartments rest on adjusters, which are double frames hinged by galvanizing arms or levers. In the bottom of each compartment under each tray adjuster are a series of holes that correspond in size to the pin of the adjuster frame. Each compartment has a thermometer, so that its temperature is accurately recorded.

As the heat of the compartment increases through the heat of the hatchable eggs the thermometer shows it, and then the trays are lowered on the adjuster frame. This is done by advancing the pin in the holes mentioned, each advance lowering the tray just so much, until finally when the eggs are about to hatch the tray rests on the bottom of the compartment. The first drop is made in about six days after the hatch is started, and all eggs placed in the incubator must be out by the close of the twenty-one days or they are adjudged worthless.

This incubator will take the place of about forty small machines, each heated by a kerosene oil lamp. Each lamp requiring about ten minutes' attention every morning, and the oil consumed in the hatching season costs about \$150. The big incubator, with its 7,500 eggs, does not require as much attention each day to its heating apparatus as one of the lamps of the smaller machines, and the percentage of its hatch will be fully as large, if not greater, for the atmosphere of the place when the incubator is operated will be much purer than if forty oil lamps were burning there, and pure air is one of the essential things in securing a good hatch of eggs.

In a hatching season, extending from March 1st to August 1st, this huge incubator will handle 52,500 eggs at least. If 75 per cent. hatch it will mean 39,375 young chickens. But so long as fertile eggs can be obtained this machine can be operated, and so the process of turning out young chickens at this wholesale rate may be extended the year around.

"Solium" Was a Great Scientific Hoax.

READERS of THE AMERICAN EXPORTER may have thought it strange at the time that no information was given to them about "solium," an alleged new element which a few months ago was heralded as being even more wonderful than radium. An eminent American scientist and electrician was consulted by the editor of this journal on the subject. He examined carefully the material offered and finally remarked: "If I were you I would not print a word about it *now*; it is either beyond all natural possibility or else it is a hoax." It turns out to be a hoax and the New York *Herald* gives an entertaining account of how the scientific world and many newspapers have been made the victims of a joker:

"After months of futile effort to discover traces of the alleged element known as 'solium' or 'selium,' which was described as possessing properties much more wonderful than those of radium, the scientific world has just awakened to the fact that it has been the victim of a hoax.

"It was at the time that the wonders of radium were being written about for the benefit of almost every class of publication, when discoveries in the field of radio-activity were being announced almost daily, that it was told that a hitherto unknown element had been found by an experimenter in Paris. Immediately much was written about this element which was named 'solium,' because, it was said, the light which it shed was in all respects the same as that which comes to this earth from the sun. An English authority, gravely discussing 'solium,' suggested that in all probability a discovery had been made which would furnish a rational explanation of the heat and the light of the sun.

"In France, Germany, Italy, England and in the United States scientists gave much attention to the new element. So rare was the substance that not an atom could be spared from the laboratory in which it was first separated from its surroundings for experiments elsewhere. But the method of its discovery was described, and the world was told how it might be found. The first reference to 'solium' was made in a long article published in the *Figaro* (Paris) and that journal from time to time told of the progress of the original experimenters with the remarkable element.

"Enthusiastic Americans searched the country over for a mineral from which 'solium' might be extracted. They were disappointed repeatedly, but being of great faith, they did not despair. Dr. George F. Kunz, who had been making a careful study of radium, was puzzled by the first report which came to him concerning 'solium.' The phenomenon described from Paris did not seem to him to be natural, and he was not one of those who spent much time searching for the new element in this country. Instead, he caused an investigation to be made, and he has just received word which confirms what he has believed all along to be the case, that there is no such element as 'solium.'"

Opening for Machinery in Australia.—The Canadian commercial agent at Sydney, New South Wales, reports the extraordinary success of artificial irrigation on comparatively small areas of land, and predicts for it a great future. The prospects for selling pumping machinery, motors and other power generators—as, for instance, windmills and steam, oil and hot-air pumping machinery—are very good.

OUR WRITING MACHINES.

America Now Produces an Endless Variety to Suit the Whims of Everybody.

BUSINESS men throughout the world are using typewriters more and more than ever before, and they have been liberal patrons of the machines advertised in our columns. The industry in America has been growing rapidly, new factories have been built recently and new ideas have been coming out in commercial form. The New York Times has made a study of the situation and its deductions are of more than ordinary interest.

The report prepared under the direction of the United States Census Office in 1900 showed that the amount of capital then invested in the manufacture of typewriters and supplies throughout this country was, approximately, \$8,500,000, which represented the value of land, buildings, machinery, implements and live capital utilized, but did not include the capital stock of any of the concerns engaged in the industry. The value of the products turned out was about \$7,000,000.

There are indications that since the issuance of this report the total amount of capital employed in the typewriter industry has increased in the United States to about \$12,000,000, and that the value of the product increased correspondingly. Although, naturally, some of the concerns which have sprung up of late years have failed, there is abundant proof that many of them have succeeded, and that their machines are installed in offices and elsewhere. Among these machines there are some whose mechanism is very simple and others whose mechanism is extremely complex, at least to a layman. Ten minutes' examination of some of them is sufficient for any one to obtain a fair knowledge of their construction, while to understand the why and wherefore of others would require weeks of study.

It is doubtful if the development of any other modern device has been so rapid during the last twenty-five years, and few persons are to be found who claim to be familiar with the construction and operation of one-half the typewriters now in use. In attempting to explain why it is that under the present conditions there is a good demand for a score or more of these machines, a New Yorker of experience said:

"In the first place, no two operators write alike, because no two are of precisely the same temperament. One may depress the keys with a slow and even touch, another's touch may be quick and jerky, that of a third exceedingly irregular and clumsy and awkward in style. The would-be expert strives to cultivate a quick and methodical style of fingering the keyboard, and naturally chooses a machine capable of fine adjustment. A salesman will invariably tell you that the make of machine he handles is susceptible to the most delicate touch, but his statement is not always true. A slow operator, or one who cares more for the appearance of his work than for the speed with which it is done, usually selects a typewriter that looks to be strong and durable, and unlikely to balk or get out of alignment. Others have queer notions about the cause of 'sticking'—that is, the refusal of the typebars to strike—and will not buy a machine which appears to be intricate in construction.

"There is another body of operators who invariably insist on having the very latest machines produced. They resemble the bicyclist who willingly exchanges a wheel that is in good working order and practically new for another of a later model and pay \$25 to boot. If they get the impression that their machines are out of date, that settles it; they must get rid of them. On the other hand, there are old, pioneer operators who claim that the machines made five or ten years ago are superior to those of the present, and they practice what they preach by using what are commonly called antiquated models.

"There are other operators to whom the sound of a typewriter is exceedingly objectionable, and who make it a point to obtain the most silent machines to be had. They are not particular about the size of a machine or its peculiarity of action, but it must be, as they say, noiseless. It often happens that an operator occupies the same office as his employer, and that the latter objects strenuously to a machine with a loud click.

In recent years the light-weight typewriter has won a host of friends. Hundreds of people, among them clergymen, authors and newspaper reporters, desire a machine which they can pick up and carry easily, and perhaps put in their traveling bag; they have no use for one of large frame which occupies almost as much space when encased, as a small trunk. They consider portability before all else.

"There are to-day as many sticklers for faultless alignment as ever, but the question of touch above referred to is one in which the largest number of persons seem to be interested. Beginners, as well as experienced operators, are fastidious about the amount of pressure necessary to depress the keys, and, moreover, about the distance the keys drop when they are struck. Attempts have been made to lessen this distance and to facilitate the action of the keys, but they have been successful only in a measure. It is true we now have so-called power or electrical typewriters, which have met with some favor. In using these machines it is only necessary to touch the keys with sufficient force to release the latch mechanism, and electricity does the rest. The mechanism is operated by magnets, the circuit being closed whenever the writer strikes a letter.

"Discussion over the advantages of single and double keyboards, which has engaged the attention of manufacturers and expert operators for many years and has resulted in decided prejudices on one side and the other, will probably continue, but it really amounts to very little, as observation shows

that machines of both styles have their adherents, whose views are not likely to be swayed by individual opinions.

"Unquestionably, the 'visible writing' machines have something of a call over the others, but people not familiar with the facts would be surprised to know that some operators care very little about seeing their work while they write. They say they prefer to have it hidden, as it is in most cases, because if it were constantly in view it would tend to sidetrack their train of thought, so to say, or perhaps disturb a burst of eloquence. As a matter of fact, a skilful operator rarely examines his work until it is finished, and wouldn't look at it if it were in sight.

"A machine's price also has much to do with its sale, especially with beginners, but the person who becomes thoroughly acquainted with one or more so-called high-grade machines isn't apt to be influenced by their price, for he knows he can rent or buy at reduced figures a second-hand machine of the style that suits him which will answer his purpose."

Using Exhaust Air for Sweeping.

THE process of cleaning and sweeping by the use of the old hand-broom, which has been ameliorated somewhat by the patented carpet-sweepers, will now be still further relieved by a new process which employs exhaust air. A small electric motor drives an air-pump which maintains an exhaust of several pounds per square inch. The whole apparatus can be made portable on wheels, and to it is attached a dust receptacle, which is of ample capacity and is tightly closed. From this receptacle extends a rubber hose connection of sufficient length to extend to any part of the house. At the end of the hose is a nozzle "cleaner" or "renovator." This nozzle is a tube flattened at the end into a long slit opening, and so made that when it is rubbed up and down over a carpet or surface of floor or cloth it sucks up the dust therefrom at once, not only from the surface, but also from the body of the carpet or cloth and from underneath it, thoroughly cleaning the whole material. A severe test of the apparatus to show its effectiveness has been made by sprinkling and rubbing flour into a carpet, the vacuum cleaner removing every particle of the flour without injury to the carpet.

This apparatus has a special merit, in that it raises no dust, but, on the contrary, quickly removes and disposes of it, without harm to health. Not only carpets, but walls and all surfaces can be cleaned. In large buildings, stores, theaters, etc., a permanent and stationary plant can be installed in the cellar with hose connections on every floor or room. To these connections flexible hose would be attached and cleaning readily accomplished by removing all dust to the basement. The apparatus requires no special skill and provides a ready and effective method of cleaning street cars, machinery and electrical apparatus.—*Farm Implement News*.

Lipton's Irish Bacon from American Hogs.

THAT Sir Thomas Lipton buys American horses in Chicago, sends them to Ireland, and trains them, subsequently selling them to Englishmen as Irish jumpers, was asserted recently by Secretary Wilson, of the United States Department of Agriculture. Mr. Wilson also said that the well-known yachtsman buys American pigs in Chicago, and, canning them, sells them in England as Irish bacon. The Lipton revelation came out while Mr. Wilson was talking to the House of Representatives Committee on Agriculture about the breeding of American domestic animals.

The Secretary said afterward that he did not mean to imply that Lipton stood alone in selling American meats as Irish. "Nearly everybody else does the same thing," said he. "All the meats that go from this country are sold as English meats and Irish meats and Scotch meats." All of which goes to show an appreciation of American products that is spreading all over the world.

Denmark One of Our Good Customers.

TRADER relations between Denmark and the United States remain most cordial. Denmark is one of our best customers. In proportion to her population, she is almost as good a customer as Great Britain. A glance at the value of our exports to the latter country will emphasize the significance of this statement. The value of our exports to Denmark in 1901 was greater than in any year before or since. In that year our direct exports to Denmark were in value \$23,292,000, and the value of indirect exports was sufficient to increase this amount by several millions and place us second only to Germany in the list of countries enjoying trade relations with Denmark.

The Danes are very prosperous people. Denmark is essentially an agricultural country. However, one-fifth of the entire population is centered in the city of Copenhagen, and Copenhagen is essentially a commercial center. Opportunities for increasing our trade with Denmark are good.

Big Exportations of Steel.—The most important feature in the steel situation in America in the month just closed was the sale of a very large tonnage of ingots and billets by the United States Steel Corporation for export. It is stated that the corporation has sold all the crude steel that it can take care of during the first quarter of the new year. The full tonnage disposed of is not made public, but it is rumored that the orders realized will net the corporation about \$13 per ton.

"Standard" Porcelain Enameled Lavatories

THE "COPLY," PLATE 1035 G

Standard Sanitary Mfg. Co.

PITTSBURGH, U. S. A.

are made in many beautiful and artistic patterns, in one piece, free from cracks or plaster paris joints, and are therefore absolutely sanitary.

"MODERN BATHROOMS"

Our beautiful book shows the "Copley" and other "Standard" fixtures, with approximate costs, and will be sent free on request. Every piece of "Standard" Ware bears our "Green and Gold" guarantee label, and has our name "Standard" or initials "S. S. M. Co." cast in relief on the exterior. No others are genuine.

Rubbing Beds,

Gang Saws, Derricks,
Traveling Cranes.

Patch Electric Floor Surfer and Polisher.

The Patch Electric Floor Surfer and Polisher is a device to dispense with the labor usually employed in dragging heavy weights over tile and mosaic floors to produce an even surface. It is also serviceable for polishing large granite and marble surfaces, and sanding wooden floors. The motor is 2-horsepower, and will be furnished any voltage required. The voltage required should be particularly mentioned when ordering. The surface wheel is 20 inches in diameter. The sand box and water tank are conveniently located, supplying either sand or water as desired. The truck wheels have a heavy rubber tire, thus preventing marring the surface. The machine is shipped ready for immediate use. Gross weight, crated, 900 pounds. Net weight, 800 pounds.

At Home and Abroad.

"We have a number of your

Burt Exhaust Heads

in use in our plants both in this and in foreign countries and have always found they GIVE PERFECT SATISFACTION, and we cheerfully recommend them," says THE DIAMOND WATCH CO.

The BURT EXHAUST HEAD removes all moisture from steam that comes out of the exhaust pipe, carries the water back to the boiler, if desired, and stops the disagreeable noise.

BURT MFG. CO.,

3,000 WORDS IN ONE MINUTE.

American Invention May Revolutionize Telegraphy, and Change Business Methods.

MANY devices have been put forward to accelerate the transmission of messages by telegraph. A recent innovation which has attracted attention in America is the "telepost," by which the inventor claims to be able to send fifty words in one second of time. In some directions electricity has its limitations, and the feat of sending and receiving 3,000 words a minute, as a commercial proposition, seems to be one of them. The inventor has been able to make some important newspapers believe that his system is practicable, although none of them has undertaken to use it. The invention, if it is all that is claimed for it, is marvelous. The *New York World* is responsible for the following account of the invention which will so cheapen and revolutionize the methods of correspondence that the postal services of all countries will make way for telegraphy. This is such a remarkable innovation that in reprinting the following account from the *World* we have not stricken out the technical sentences:

"The present rate of handling commercial business over telegraph wires is something like fifteen words a minute. 'Press,' or newspaper matter, usually sent by a cleverly devised code that condenses whole sentences into three or four letters cannot now be handled with greater rapidity than an average of 2,500 words an hour. The fastest operator in the country sent 3,000 words in a single hour in a trial for record, but even he does not claim it could be kept up beyond one hour.

"The sending apparatus of the new system is a box-like device, into which a tape of paper is reeled, and which cuts tiny round holes in the paper in response to pressure on keys arranged like those on a typewriter. The symbols thus made, by a plan of double dots and the spacing of the perforations, form a Morse alphabet in holes. As these holes pass under a delicate pair of electric 'brushes' they open and break the current, which causes the communication, just as the hand of an operator on a key opens and closes the circuit for short and long periods which make the dots and dashes forming the Morse code.

"Receiving is accomplished in any one of three ways. The first is intended to be the most practicable for the rapid system. It is the recording of the message in written 'Morse,' the same as is used at present on the Wheatstone method. As the interruptions of the current occur, they affect two little steel fingers or prongs that rest upon a chemically prepared tape fed into the receiver. Between them is a needle or stylus, which discolours the chemical solution on the tape and marks it with the dots and dashes of 'Morse.'

"These dots and dashes, transcribed into letters and figures in the hands of experts, are delivered as the actual messages, or the strips of holes can be taken to another sender and forwarded to a branch office. If so desired, the same yards of holes can be placed on a sending apparatus and ticked off as slowly as required into the ear of a receiver who isn't bothered with a stress of business, in the same clicks that spell out words to an ordinary operator by the present method, only with perfect precision instead of the unsteadiness which is absolutely unavoidable by human agency."

According to the *World*, it is the ultimate design of the inventor to make of his system a "telepost," by which correspondence will be conducted with the swiftness of lightning, so that whole letters may be forwarded to distant points and answers received within a few minutes. That this can be accomplished he is entirely sanguine, and that the rate of such communication will be brought to a very low figure, he argues, from the tremendously increased capacity for handling business on the same equipment as now exists. If practical experiments substantiate the claims of the inventors we will inform our readers of the fact.

Better Demand for American Furniture.

AMERICAN furniture is becoming more popular abroad, judging by the increase in the exports, and firms engaged in it are confident that it is going to grow in proper ratio with other commodities. A man well posted in the trade said a few days ago: "We have been gaining rapidly. There are two concerns in New York which export quite heavily. One sends out nearly all classes of furniture, and the other confines its output to desks and chairs. Our greatest success has been in the cheaper and moderate-priced grades of furniture. Our manufacturers find markets abroad for practically all lines of furniture, such as chairs, tables, desks, beds and upholstered parlor sets. British Africa and the Spanish-American countries in my opinion, offer the best field for further expansion of the business."

An exporter said: "Americans have reached a stage in cabinet work where we can compete with the most artistic makers of Belgium and France. I have sent curio and music cabinets, desks, cellarettes and other furniture to Montreal and Quebec, for houses that previously would have no furniture except what was made in France. In designs, in decorations and in painting on wood we have artists who are as clever and as originaive as those abroad. There is no doubt at all that much of the furniture sold in this country as imported goods are made here in New York and in some of the American furniture centers. It is a deception for retailers to sell American furniture to customers who suppose that they are getting imported articles, but in actual work of the goods no injustice is done. A few years ago the finer grades of imported furniture could not be duplicated by any made in the

United States. Now no expert can tell the difference, because in material, in workmanship, in strength, durability and resistance to climatic influences, our cabinets and desks and other articles are fully equal to any foreign products. Some of our fine grades of goods have been sold in Paris. Most of the export business at present, however, is in the common furniture, such as chairs and beds, and in getting this class of business the main factor is in offering the lowest price."

Growth of Our Exports of Boots and Shoes.

EXPORTS of boots and shoes from the United States show a steady growth, and for the calendar year 1903 aggregate more than \$7,000,000 in value in 1893 they were less than three-quarters of a million dollars in value. Few of the important articles entering into our export trade show a more rapid growth in exports or a wider distribution than boots and shoes. More than sixty countries and colonies are named by the Department of Commerce and Labor through its Bureau of Statistics as the destination of the boots and shoes exported from the United States in the year about to end. England, Germany, France, Belgium, Denmark and the Netherlands, in the order named, are the chief European customers, and to Europe is sent more than one-third of our total exports of boots and shoes. England takes more than all the rest of Europe, much more than any other country, the amount being nearly one-third of our total shipments abroad.

In North America, Canada, Mexico, Cuba and the British West Indies are the largest consumers of our boots and shoes, while the South and Central American countries also take greater or less quantities, though not in proportion to the amounts taken by the West Indian islands, Mexico and Canada. Australia is a large importer of boots and shoes from the United States, nearly one-sixth of our exports in that line being to British Australia. Africa is also a considerable importer of boots and shoes from the United States, especially British Africa.

The United States now stands easily second in the list of the world's exporters of boots and shoes, while an examination of the relative growth of exports of this class of merchandise from the United Kingdom and the United States, respectively, justifies the conclusion that we shall soon overtake that friendly rival in the race for this contribution to the world's wants and consumption. Another interesting fact developed in a comparison of the figures of exports of boots and shoes from the United Kingdom and the United States is that the value per pair of the boots and shoes from the United States is apparently about 60 per cent. greater than that of those exported from the United Kingdom.

Better Transportation to East India.

THE growth of American trade with East India has led to new competition in transportation in that direction which will add to the facilities which our exporters are requiring through increasing orders. The *Brooklyn Eagle* reports that the shipping firm of Barber & Co, New York, appears to be engaged in a struggle with Norton & Son for the Bombay, Calcutta and Rangoon trade. The *Eagle* says under date of January 24th: "The steamship Anglo-Canadian is loading at the Commercial wharf, Atlantic dock, for the ports named. The Norton people advertise the sailing of a Bucknall line steamship, name not given, for Bombay, Colombo, Madras and Calcutta. The Anglo-Canadian will carry about 8,500 tons, and 1,000 more tons of freight are reported to have offered than the Anglo-Canadian can carry. She will take out an extremely large shipment of lubricating oils, aggregating 17,000 barrels, for Bombay and Calcutta and 2,500 drums of naphtha for the same ports. The United States Steel Company sends out over 1,400 tons of structural and bridge material; the balance of the cargo consists of domestics, sewing-machines and general merchandise.

"Barber & Co. and Norton & Son have long been associated in the South African shipping combination, but until this move Norton & Son had control of the Bombay and Calcutta trade. This departure of Barber & Co. looks like the commencement of a freight rate war to the East Indian and Singalese ports."

Such a war, if it materializes, will be welcomed by American exporters and their customers at the points affected.

Railroad's Farming Innovation.—An American railway company in the State of Illinois has planned an innovation for the farmers along its line. It has rigged up a portable motor, and whenever any of the farmers want power to run a thrashing-machine, shredder, wood-cutter or other machinery the motor will be set up in the farmyard or barn and connected up with a portable wire connection to the lines of the railway. It is claimed that this will afford the farmers a cheap power for grinding and other uses. The railway people will also undertake to permanently afford a lighting plant for farmhouses and barns.

Electric Cranes for South Africa.—General Manager Hammersley Heenan, of the Cape Town Docks, has recommended to the authorities of that South African port that the docks be installed with electric cranes and travelers. It is expected that American equipment will be selected, as the suggestion came from observation of the good work done by American electric products.

Knock-Down Office and Home Furniture for Export. The "GUNN" K. D. Sectional Bookcases.

List, \$3.00

9 1/4" Section
List, \$4.15

11 1/4" Section
List, \$4.50

13 1/4" Section
List, \$5.25

Base Section
List, \$2.65

THREE-SECTION CASE.

With top and base set up. Weighs 135 lbs. gross, 100 lbs. net, and of 6 3/4 cubic feet. This cut represents the entire line of sizes, and will make a case for 10 books or 10,000 books, growing as the books accumulate. Measurements are inside. All sections 10 1/2 inches deep and 32 1/2 inches long. Made of selected quarter-sawn oak and handsome polish finish.

THREE-SECTION CASE, as shown, complete - - - each \$10.76
SIX-SECTION CASE, as shown, complete - - - each \$17.98

IMPORTANT NOTICE.—To secure full benefit of above, even sample orders should not be for less than the steamship minimum for issuing ocean bills of Lading. Some steamship companies accept not less than 40 cubic feet, while others not less than 80 cubic feet. Six Three-section Cases occupy 40 cubic feet; Four Six-section Cases occupy 40 cubic feet. NOTE explanation of ocean freight on "Gunn" K. D. Cases: "An ocean rate of 10 shillings per 40 cubic feet equals a cost of eight cents per section, or about four per cent. on the cost boxed f. o. b. New York."

Specify "Gunn" when ordering. Orders received direct or through export houses. When ordering through the latter, to avoid errors, please mail us duplicate of order. Our catalogue, illustrating and describing the various styles of Sectional Bookcases and Filing Cabinets made by us, mailed postpaid.

THE GUNN FURNITURE CO., Grand Rapids, U. S. A.

Western Union and A. B. C. Codes used.

Cable Address: "GUNN," Grand Rapids.

We also make a full line of Roll and Flat Top Office Desks and Typewriter Cabinets.

A FEW REASONS WHY THE "GUNN" K. D. SECTIONAL BOOKCASES ADMIT OF DIRECT IMPORTATION TO THE TRADE.

The assortment is SMALL. All parts are INTERCHANGEABLE, making every possible size bookcase from the same stock. They require but little space in warerooms, as the cases are shipped K. D. (flat) and can be set up as required, with no tools but the hands.

Our method of boxing K. D. (flat) insures arrival of goods in PERFECT CONDITION, as NO POSSIBLE DAMAGE CAN OCCUR TO FINISH AND NONE OF THE PARTS CAN SWELL OR WARP, as in ordinary furniture. Deliveries can be made in thirty days, and by using our special code, twenty days.

ADVANTAGES OF THE LINE.

The field to sell is very large, as the same stock meets the demand from offices and public buildings, as well as for home use—in fact, anywhere an article is desired to be covered from dust and moisture. Each sale made is a guarantee of repeated purchases for additional sections, as books accumulate. The sections can be added, vertically or horizontally, to fit the wall and space. The glass doors, when raised, disappear, sliding on small frictionless roller bearings. The "GUNN" is the only case in which a broken glass can be replaced by simply taking off the door, and without removing the books or taking the case apart. The cases, when set up, present a handsome appearance, with no objectionable features, and are as rigid as an ordinary bookcase.

We GUARANTEE the "GUNN" SECTIONAL BOOKCASES PERFECT IN ALL RESPECTS.

Special Offer for Export Only:

The prices here quoted (U. S. gold or its equivalent) include boxing for steamer, and delivered f. o. b. cars at New York City.

"Gunn" K. D. Sectional Bookcase.

This cut shows our knock-down (flat) construction. It is put together without nails or screws, or dowel-pins; the irons that are fastened to the shelves have upper and lower tongues that fit in the grooves in the bases, center sections and top sections, thereby binding all rigidly together.

MACHINE TO PICK COTTON.

Will Cheapen the Marketing of a Commodity That Is in General Demand.

COTTON is one of the most interesting commodities at the present time. Manipulation of it has closed mills throughout the world and has caused inquiry and investigation to be set afoot to enlarge the world's cotton-producing acreage. We have given more attention to this subject than would interest most of our readers, but the cotton question affects millions of people, and in view of the spread of the cultivation of the article, it will be interesting to many of them to learn the particulars of a unique American invention. It is vouched for by the New York *Herald*, and the *Herald's* story of it follows: "A Memphis man, who has for some years been at work on a pneumatic cotton-picker, has been granted patents on several improvements on his machine. The invention of a machine that will pick cotton, one that can do the work that the negroes are called upon to do, has been the goal of many an inventor for a half century. Many thousands of dollars have been spent in trying to give to the cotton States a picker that would pick. This machine was tried last season, minus several of the improvements, for which the inventor has just been granted a patent, and did good work. The picker tried during the present season had most of these improvements and did the work highly satisfactory to the inventor and the capitalists who are backing him.

"The machine is called a pneumatic cotton-picker. It is mounted on a high-arched frame, something like a wagon. This wagon covers one row. Hose attached to different part of the machine allow the men operating it to pick two rows on each side of the machine, which, with the row under the picker machinery, give a total of five rows that can be picked at one trip. The speed with which the cotton can be gathered depends on the skill of the men who have the handling of the hose. There are four lines of this hose, directly connected with a 26-inch blower, which pulls the cotton from the bolls, through the blower, and dumps it in a large bag attached to the bed of the machine. Power to run the blower is obtained from a six horse-power gasoline engine at the front of the picker frame. When the end of a set of rows is reached all that is necessary is for the driver of the two mules to turn around and go back over another set of rows.

"One of the operators, or the man who drives the team, is supposed to watch the bag, and when it is full unhook it and attach another, which takes but a few minutes. These bags, owing to the force with which the cotton is sent into them by the powerful blower, are packed tighter than they can be 'tramped' by the old-time method. Five men are required to operate the picker. It has a capacity of 4,000 to 5,000 pounds of cotton a day of ten hours, or about 1,000 pounds a man per day—more than four times the amount that can be picked by hand. The expense of operating is small, and thus it will be much cheaper in the long run to pick cotton by machinery. All of the cotton handled is much cleaner than the product picked by hand. The ends of the hose are so constructed as to catch nearly all of the leaves attached to the open bolls, but will not pull the bolls to pieces."

Refuse Rubber Is Now Made Valuable.

AMERICAN inventive genius has again solved the problem of creating something out of nothing, or, rather, making money out of refuse.

Worn-out rubber, like worn-out silver, is something that does not exist in these days. Ever since the advent of bicycles and motor cars, both of which drew heavily on the world's rubber supply, and ever since the hundred and one uses to which rubber is put in connection with electricity, the material has become more and more scarce and valuable, so that even the old rubber shoe and the worn-out rubber boot may throw out their chests in pride at being worth really something. Nothing containing rubber is discarded nowadays. The old rubber coat over which the spring tires of a motor car may run on a country road to-day may some day find a nesting place in the soft tresses of a woman's hair, after having been transformed into a handsome comb.

Even vulcanized rubber, which, owing to the sulphuric process to which it was subjected, was formerly valueless, is now subjected to a process which rejuvenates it and makes it fit to be worked up again for the purposes of the manufacturer. Immense quantities of this product, which formerly was assigned to the rubbish heap, are now treated and admixed with a certain percentage of new gum, enough to cheapen the price of most rubber goods turned out by the manufacturers to-day. Old rubber, however, can be used by itself without any addition of fresh gum, the process of treatment being a simple one.

Panama Canal Inspires American Business Men.

COMING events connected with the Panama Canal are casting their shadows before. The New Orleans Board of Trade, the chief business body of the Southern metropolis of the United States, has given its indorsement to a project to build a line of steamships to pass through the canal and trade with the Western countries of South America and with Asia. The plan is to build a fleet of large, swift, modern vessels, to interest the entire Mississippi Valley in the project, to raise \$5,000,000 for the work and to get the Governors of the States in the valley, the mayors of the cities and

all its commercial bodies to take a hand in the scheme by way of subscribing for the stock or receiving subscriptions.

This is a move in the right direction. A committee of the New Orleans Board of Trade has been appointed to get the project into practical shape. It is proper that New Orleans should take the lead in this scheme. That town is the principal seaport in the valley and the valley will be the chief beneficiary of the canal. A large part of the ocean trade of the Mississippi watershed will pass through that port. The Mississippi watershed runs north and south through the center of the middle western section of the United States.

When the canal is opened New Orleans and all other points in the Mississippi Valley will be brought several thousands of miles nearer by water to the west coast of South America and to Asia than they are now. This will be an item of incalculable importance in the extension of the trade of that section with those regions. The project for the building of a line of steamers to South America and Asia will have great interest for all the valley.

Success of American Glass-making Machines.

IN our issue of last April we printed an account of the new machines to make glass. They are now in practical operation and this letter from a correspondent at Hartford City, Ind., will prove interesting to those of our readers who are concerned: "There is no longer any doubt that the window-glass blowing machines have superseded the human blowers in all the plants of the American Window Glass Company, and that they are a great success. The company has just started ten more mechanical blowers in addition to six in the No. 3 plant here, which have been in operation since September. This will give the Hartford City plant of the trust the largest number of mechanical blowers of any factory west of Pennsylvania. Each machine has an output equal to that of eight blowers, eight gatherers and eight snappers. The sixteen machines have 108 pots capacity, and the displacement of 324 skilled workers and almost an equal number of common laborers will follow.

"Few persons have any conception of the vast saving these machines have over the human blowers, the highest-priced skilled workmen in the world. At a labor cost of not to exceed \$20 in the blowing-room the six machines at factory No. 3 made 1,444 twenty-foot rollers and more than 100 pieces in two shifts of seven hours each the other night. When cut this made more than 200 boxes and represents more than the work of three skilled workmen for a full month, the limit fixed by the union being 192 boxes. Six machine tenders and six snappers, three of each for each shift, with wages of \$1.50 a day, or \$18 for all, made this amount of glass. The wages of a blower would have been, with his gatherer and snapper, at least \$350.

"The difference in wages of more than \$300 on 200 boxes of glass shows how even with its large investment in machines, the American can turn out glass by machines cheaper than can be done by human blowers at anything like present wages, even after allowing 8 per cent. on the investment for the machines. The American operated 118 pots capacity here last year with human blowers. This year it employs none."

China at the American Exposition.

CHINA'S exhibit at the American World's Fair this year will be a display of Oriental splendor and will be made by the Chinese Government proper, which is the first time in the history of the celestial empire that such a thing has been done. Funds for the exhibit will be appropriated from the Imperial coffers at Peking, being secured largely through the influence of the Dowager Empress Ann, who is greatly interested in the Exposition.

The little force of Chinese workmen now in St. Louis, U. S. A., has begun the installation of the intricate hand-carved interior woodwork of the Chinese national pavilion. The woodwork was recently received from Shanghai and consists of about 6,000 pieces.

A shipment of building material and totem poles arrived from Alaska, and six native workmen are expected to arrive early this month to begin the erection of the two native structures surrounded by totem poles, which will flank the main Alaska building.

1903 a Record Breaker for Foreign Trade.

THE preliminary figures of the Bureau of Statistics of our total imports and exports for the calendar year 1903 show that the foreign trade of the United States was for that twelvemonth the largest in the history of the country, not only the largest in the aggregate, but in both imports and exports, reckoned separately. The total for imports and exports together was \$2,480,141,228, against \$2,330,002,803 for the previous year and \$2,345,795,770 for 1901, when the highest previous record was reached.

Of exports the total value for 1903 is put at \$1,484,668,127, which is an increase of \$123,982,194 over the previous year. Another high-water mark was recorded in the exports for December, which footed up a total of \$174,734,368.

Electric Motors for South Africa.—The Westinghouse interests are manufacturing large lots of electric motors at their plant in Newark, U. S. A., for shipment to South Africa.

BALKE MANUFACTURING CO.,

Patentees and Manufacturers of
Balke Combination Davenport, Billiard and Pool Tables,
and Standard Tables.

INCORPORATED \$100,000.

Style "A," as a Davenport.

Benedict Special Billiard Table.

No home or club is thoroughly equipped unless it contains either a Davenport or Standard Billiard or Pool Table or Combination Billiard and Pool Table. We make both, of the highest grade and of the highest quality.

Note—The prices here quoted, U. S. Gold or its equivalent, are for **Foreign Markets Only**, and include boxing ready for steamer, delivered f.o.b. cars at New York City.

Style "A," as a Davenport, is made of quartered sawed oak covered with N. Y. leather, and, as shown, is a handsome adjunct to a parlor or clubroom.

Style "A," converted into a Billiard or Pool Table, has a playing surface of $3\frac{1}{2} \times 7$ feet; has 6 polished maple cues, and 4 genuine ivory billiard balls for billiard table and 16 best quality composition balls for pool table. Price complete, \$95.00. Gross weight, 800 pounds; net weight, 650 pounds. Size of boxes: $4' \times 8' \times 6'$; $32'' \times 36'' \times 6'$.

Standard Billiard Tables.

"Benedict" Special is the best table for the price ever offered. The bed is of Vermont slate; imported billiard cloth; cushions are made of the best rubber. Furnished with 12 polished cues and 4 genuine ivory billiard balls. Size of playing surface is 4×8 feet. Price complete, \$100.00. Gross weight, 1,240 pounds; net weight, 920 pounds. Size of boxes: $4' \times 8' \times 3\frac{1}{2}' \times 8'$; $4' \times 8' \times 2' \times 2'$.

"Den" Special is just the table for the den; made of oak, while the bed is of Vermont slate; furnished with 6 polished cues and 4 genuine ivory billiard balls. Size of playing surface, $3\frac{1}{2} \times 7$ feet. Price complete, \$90.00. Gross weight, 700 pounds; net weight, 500 pounds. Size of boxes: $4' \times 8' \times 8'$; $3'6'' \times 6' \times 2'$.

Orders received direct or through export houses. When ordering through the latter, to avoid errors, please mail us a duplicate of your order. Our catalogue, illustrating and describing the various styles of Billiard and Pool Tables manufactured by us, mailed postpaid.

Style "A," converted into a Billiard Table.

"Den" Special Billiard Table

BALKE MANUFACTURING CO., Grand Rapids, Mich., U. S. A.

CONTINENTAL CAR AND EQUIPMENT CO.

FOREIGN DEPARTMENT:

Whitehall Building, Battery Place, New York, U. S. A.

Cable Address: "CONEQUICO," New York.

MANUFACTURERS OF

Railway Freight, Plantation, Industrial and Mining Cars.

ALL-STEEL FLAT CAR.

CUBAN CANE CAR.

GONDOLA CAR.

PUERTO RICAN CANE CAR.

We also make Special Cars for all purposes, from designs furnished, or will furnish our own designs upon request.

FOR FOREIGN MARKETS.—Our Cars are taken apart and packed for shipment according to the best known methods.

Our Catalogue (English and Spanish), illustrating and describing the various styles of STANDARD CARS made by us, mailed postpaid.

Please mention THE AMERICAN EXPORTER.

"A TWENTIETH-CENTURY MARVEL IN WASHING MACHINES."

THE Guarantee

FOUR-STROKE ROTARY

Washing Machine

Just placed upon the foreign and home markets, combines the Latest Improvements in High-Speed, Ball-Bearing Washing Machines and will accomplish all that is claimed for or required of any washing machine, and more.

NOT A SPECULATION BUT AN INVESTMENT, the returns of which will pay you ONE HUNDRED (100) PER CENT.

GUARANTEE WASHER.

GUARANTEE WASHER.

FOR TWENTY DOLLARS

in U. S. Gold, or its equivalent, we will crate, ready for steamer and deliver f. o. b. cars at New York City, **Four (4) Guarantee Four-Stroke Rotary Washing Machines.** (Retail in the United States of America at ten dollars each.) Weight, three hundred pounds. Order **FOUR NOW.** Later you will order in large quantities.

MICHIGAN WASHING MACHINE CO., Mfrs., Muskegon, Mich., U. S. A.

Also makers of the world-known "Muskegon" and "Michigan" Washing Machines, over 250,000 of which are in use throughout the United States.

NOTE.—When ordering through export houses, to prevent mistakes, please mail us a duplicate of your orders.

The WATROUS SANITARY SPECIALTIES

The Watrous Combination Bath Fixture.

This fixture supplies hot or cold water or any desired mixture, by simply turning the handle to the right or left. To empty bathtub, simply lift the handle.

It is the only perfectly sanitary bath fixture made, as the tube is always filled with clean water direct from the supply instead of from the tub, and therefore impossible to become foul.

Has an independent supply passage direct to tub. **Can be attached to any bathtub.** Is constructed with ordinary Fuller balls. Is simple, cheap, durable and heavily nickel plated.

Upon receipt of price we will box, ready for steamer, and deliver F. O. B. cars New York, as follows:
One (1) Watrous Aquameter Water Closet, complete (Fig. "A 4.") as shown. Six (6) cubic feet. Weight, 100 pounds.....\$30.00
One (1) Combination Hot and Cold Water Bath Fixture, as shown. $\frac{1}{2}$ cubic feet. Weight, 17 pounds.....\$15.00

Our sanitary specialties are protected by U. S. and foreign patents. Our illustrated booklet mailed, postpaid, to any part of the world. Please mail us duplicate order when ordering through commission houses.

The Watrous Aquameter Water Closets.

Adopted by **The Pullman Company** and **all important Railway and Steamship Companies** in the United States.

These closets have no equal for **Public Buildings, Residences, Steamships, Private and Parlor Cars.**

The closet shown operates perfectly with $\frac{1}{4}$ -inch or $\frac{3}{4}$ -inch pipe, according to pressure.

Connected direct to service pipe, without any tank. Uses from one to three gallons of water to each flush. Saves 50 per cent. in water bills. Noiseless and positive in action. Neat and durable. Successful everywhere. Fully guaranteed. Thousands in use everywhere.

Figure "A 4." Watrous Aquameter Water Closet.

Watrous Combination Hot and Cold Water Fixture.

THE WATROUS COMPANY, Manufacturers, CHICAGO, U. S. A.

American Automobiles for 1904.

THE January automobile show in New York City this year was a decided success. The American exhibits far outnumbered the foreign ones, although the latter made an extremely good showing. The exhibition developed that American manufacturers had made great advances. Foremost among the noticeable features of the great show was the exhibition of automobiles that were built for practical and commercial use. Instead of cars built only for fair weather and good roads the visitor found enclosed and semi-enclosed bodies, ranging from the luxurious cab and brougham forms, and the canopy top with closed front, side curtains and perhaps glass-enclosed rear, to the light, folding buggy tops, both with and without storm aprons.

Instead of the inconveniently placed rear door that has so far been the thing for tonneau bodies, he found that a marked tendency exists toward the lengthening of wheel bases and the adoption of side entrances between the front and rear seats, and occasionally of front seats that can be tilted to allow egress and ingress for the passengers in the rear. The divided front seat still rules in the heavier cars, but it is more apparent that its purpose is simply that of securely fixing the driver in his place at the wheel, for which reason there is something of a disposition shown by manufacturers to make the other front seat of less permanent form.

In one large and handsomely finished car, the property of a well-known American millionaire, one of the front seats is done away with altogether, only that for the chauffeur being retained. The space thus cleared is utilized simply as a broad platform leading from the front of the car to the enclosed rear. A small folding seat is provided to be quickly set up in this space if desired.

Aluminum has practically superseded bent wood in body construction, and although wood is still retained for framework the most enterprising builders—those least trammelled by horse vehicle traditions—seem disposed to eliminate it for every purpose except that of serving as an edge to which to tack upholstery. Upholstery is in the main of the established sort. A few pneumatic cushions were seen, especially as auxiliary cushions—for seats, foot-rests and the like—and their merit is such as to suggest that a time must come when this light and durable form of upholstering will prevail for motor vehicles to the exclusion of all else.

One manufacturer offered something of a surprise for those who prefer cars with glass fronts and enclosed sides. The innovation consisted of transparent celluloid sheets to be used in place of glass, their lightness and freedom from breakage being very advantageous. Whether the danger of broken glass is offset by the objection that the celluloid might catch fire too readily is for the purchaser to decide.

From the mechanical standpoint, a few revolutionary changes were seen, but tremendous improvement in the way of refinement of detail was observed. The pressed-steel frame has progressed considerably in popular favor, and many of the new cars make use of it. Several large ironworkers have regularly engaged in supplying automobile manufacturers with these frames, and their product will be exhibited at several stands in the hall.

Most makers adhere to springs of the established half-elliptic type, but these are becoming longer and longer, and the plates have been increased in number and made thinner. The running of the 1904 cars is made considerably smoother by these refinements in spring design.

The artillery wood wheel is now used generally, with the exception of a few very light cars with wire wheels, and some that are equipped with tubular steel wheels.

In engine design a marked tendency was found toward air cooling for gasoline engines, although the believers in water cooling have evolved systems that are considered highly reliable, simple and efficient. A great many use the honeycomb radiator, several American forms of which are built of wavy vertical tubes so nested together as to leave a multitude of air spaces.

The vertical motor in front was widely in evidence, although a few of the largest concerns still adhere to single and double cylinder horizontal types placed amidships in the body, or, in a few cases, across the front of the car. Of vertical motors those with four cylinders are more numerous than those with three, but there seems to be a strong undercurrent of opinion in favor of the latter type. Cylinder heads are almost without exception cast integral with the cylinder. The same holds true with most water-jackets, but a few are of aluminum or copper, ingeniously and firmly built on.

Jump-spark ignition is practically universal. Only one or two examples of "make-and-break" will be on view. Storage batteries and magnets or dynamos supply current for ignition in most of the larger machines, while the smaller very commonly use dry cells. Some of the ignition dynamos are so arranged as to make the use of any unnecessary; others work in connection with a battery, which is normally charged by the dynamo, but will continue to give current for some time should the dynamo give out.

The bevel-gear, or propeller-shaft drive, with all mechanism completely protected from dust and mud, is evidently preferred by a majority of American manufacturers and buyers. A separate differential shaft, with individual chain drive, is used to some extent. Many prominent makers use a single chain drive to the differential on a live rear axle.

Speed changing on the large cars is generally effected by the European type of sliding gear, but planetary and individual clutch systems are more used for the smaller vehicles. Ball bearings are used in a few of the sliding-gear transmissions.

Systems of control vary widely. Wheel steering has practically super-

seded the lever on everything except a few light runabouts, but all the way from one to three levers are used to control speed, and there are brake, accelerator, throttle and clutch pedals of all forms and arrangement. Hand levers on emergency brakes are common.

Lubrication systems seem for the most part designed with a view to requiring a minimum of attention and the assertion that one oiling will serve for a run of 100, 200 and even 1,000 miles, may be expected. Fuel and water supplies are likewise provided for on the basis of 100 and 200 mile runs.

The double-tube clincher tire has about relegated the single tube to the junk shop. The most marked advances in tire construction were noted as consisting of various provisions that are made to facilitate the ready removal of the outer casing. This is ingeniously accomplished in a number of instances, and the day of struggling for an hour or an hour and a half over the repair of a slight puncture is evidently passed.

Gasoline cars, of course, hold the center of the stage, but the types of steam machines that still survive are excellently qualified to hold their own with their more numerous competitors. Of the steam type of construction the flash system of steam generation seems generally preferred to the boiler, although one runabout with an ordinary flue boiler, carrying a normal pressure of 400 pounds to the square inch, was on view at the exhibition. The electric cars were much in evidence, and those equipped with Edison's new storage battery were centers of attraction.

During the week 70,000 persons attended the exhibition. The actual value of the autos exhibited was \$14,400,000. The vehicles exhibited were classified as follows: Gasoline cars, 185; chassis, 33; water-cooled motors, 156; air-cooled motors, 29; four-cylinder vertical engines, 28; double-opposed cylinder, 42; jump-spark ignition, 158.

Will Be Automobiles on Water.

THE development of the motor boat or watermobile has taken a fresh impetus in America, and plans have been made on a large scale. Contracts have been made for two vessels that will probably be among the most interesting boats of the coming season. One is sixty feet long and will be propelled by a single screw driven by a six-cylinder, reversible marine motor, similar to the engine used in the yacht which beat a swift shore steamship last summer. The sixty-foot boat will have 110 horse-power and a second boat will be built, ninety feet long, and of about five times the power of the other—500 indicated horse-power, using twin screws and the same type of gasoline motor.

Other contracts of lesser importance are reported, but they all tend toward higher speed and the adoption of automobile ideas in small boats.

Lewis Nixon, who is an authority on the subject, when asked as to the trend of development in auto boats, said:

"At present with many builders the tendency is to use the engine of an automobile in a boat. The danger in this is that automobile engines do not exert their full power except occasionally when on an incline, while in a boat full and continued demands are made upon the machinery. For this reason the design should be upon radically different lines, in order that the boat may give satisfaction."

Irrigating Machinery for Australia.—We have heretofore noted the great demand in Australia for our irrigating machinery, and our exporters will be interested in the following from *Modern Machinery* on the subject: "The Canadian commercial agent at Sydney, New South Wales, reports the extraordinary success of artificial irrigation on comparatively small areas of land, and predicts for it a great future. The prospects for selling pumping machinery, motors and other power generators—as, for instance, windmills and steam, oil and hot-air engines—are very good. It would be advisable to sell such machinery through agents who understand how to put it up. Some firms that sell that class of machinery for certain manufacturers could be induced to take hold of new ones, if good and cheap."

Electric Water Heater.—A Massachusetts, U. S. A., inventor has contrived a handy electric water heater, which consists of a porcelain tube, having a spiral groove on its surface, in which a platinum wire is wound, the whole being covered by a metallic tube insulated from the wire and finished with a woolen handle and a wire leading to a plug, to be inserted in an incandescent electric lamp socket. When the current is switched into the wire, it passes over the spiral platinum wire and heats it almost to redness through the resistance it offers, thus warming a pitcher of water in a few minutes by simply inserting the heater in the pitcher. This device can be carried in a small satchel and is always ready for use wherever an incandescent electric lamp can be found.

Two Metal Ceiling and Wall Exporters Consolidate.—Henry S. Northrup and Coburn & Dodge, two of the pioneer New York manufacturers of metal ceilings and walls, have consolidated their business interests under the corporate name of Northrup, Coburn & Dodge Company. The export business of the two firms, now associated, will be conducted on the same lines as heretofore.

American Conduits for Russia.—James F. Cummings, who has a \$1,500,000 contract for supplying and laying conduits for the municipal telegraph and telephone system in St. Petersburg, was in New York last month. The material for the conduits is being manufactured in the United States.

UPPER LEATHERS

SHOE UPPERS.

The American Shoe Manufacturers' Export Company begs to announce that its **LEATHER DEPARTMENT**

is prepared to furnish all kinds of leather for the manufacture of shoes of every description, in large or small quantities. Careful selections; packing in any manner desired and prompt shipments guaranteed.

Send us samples of what you use and let us quote prices.

Our Shoes Are Famed All Over the World.

We make more than 500 different kinds for men, women and children—from the cheapest to the best. We also manufacture Shoe Uppers, that is the shoe complete without soles or heels. Send for samples. See above cut.

Our **DIAMOND BRAND SHOE DRESSINGS** are the best on the market, but priced lower than other makes.

BLANCOLA is a liquid dressing for white canvas shoes that wins favor on sight.

You Take Absolutely No Chances

IN BUYING THE WONDERFUL

(For Water Tube Boilers)

The same machine can also be used for return tubular boilers, which is provided with a hammer instead of cutter as it appears on this cut.

DIAMOND BOILER TUBE CLEANER.

The only known and successful device for removing scale and soot from return tubular or water tube boilers. Same machine can be used for both styles of boilers by changing the hammer. From 20 to 60 per cent. in fuel saved; prolongs the life of boilers, and is the means of avoiding possible accidents. Our Diamond Cleaner is in use in every part of the world, to whom we can refer you. Every Diamond Machine bears this trademark and is also stamped with our name.

American Manufactures Liked in Scotland.

RUFUS FLEMING, United States Consul at Edinburgh, Scotland, in a report just issued by Secretary Cortelyou, of the Department of Commerce and Labor, sends some information that ought to be appreciated by importers elsewhere in the world, for the Scotch are proverbially certain to get the best they can obtain for the lowest practicable price. In other words, they are shrewd enough to recognize a good article at its proper value and purchase it. Mr. Fleming says in part:

"American pumps have lost none of the favor in which they have long been held. The trade is well managed. Some makers of these and other American devices have shown good business tact by sending representatives to customers in this country, not to solicit orders, but simply to take suggestions as to any improvement or change which might better adapt them to the market. This enterprise of manufacturers is a novel thing to foreign dealers and is warmly commended here. In a few cases alterations have been made in pumps and other articles to meet local wants or fancies, with good results.

"Our machine tools and hand tools continue in strong demand. By sending over poor goods a few years ago German firms irreparably injured their tool trade in this market, and they are no longer serious competitors. In 1901 the Germans had practically all the trade in steel spoons, but this has now been taken by the Americans, who make a better article at as low a price. One Edinburgh wholesale house is doing a profitable business in these spoons, which are sold principally in the country districts.

"A Scottish wholesale firm has scored a decided commercial 'hit' with an American machine-made, single-barreled, breech-loading gun, which sells at a moderate price. Galvanized goods, such as oil cans, are selling freely; the Americans have a share of this trade, and, in the opinion of prominent dealers, will obtain more of it if they keep their wares up to the present standard.

"Our woodworking machinery—for planing, sawing, molding, sandpapering, etc.—has long been used in Scotland to a considerable extent. There is an increasing sale of American clocks and watches of standard quality and moderate prices. Ship chandlers are handling fair quantities of American valves, ironware and other supplies. This trade has been growing and promises to become important.

"In furniture, roll-top desks and bookcases are still the prominent items in the imports from the United States. The desks are sold largely, notwithstanding that the local office-furniture manufacturers have copied them closely and made special efforts to keep out the foreign article.

"Dealers in American shoes report an increasing trade. Our styles gain popularity and prices of the best grades are low, compared with the prices people heretofore paid for home-manufactured shoes. A notable effect of the American 'invasion' in this branch of trade is a general reduction of the extraordinary profits of retail dealers before the introduction of American stores. Grades of British-made shoes which sold for \$6 four years ago can now be bought for \$4.

"Our leather, both sole and upper, has been imported in somewhat larger quantities than last year by British shoe manufacturers, owing, it is said, to their increasing orders from the colonies. Not only is the British shoe made chiefly of American leather and by American machinery, but even the metal hooks and eyelets are practically all imported from the United States.

"Our axes, heavy and light, are still prime favorites; neither British nor continental makers can equal them in the combined merits of excellent quality and cheapness.

"Our soaps, toilet and common, are used more than ever. The enterprise of American manufacturers of the better grades is notable, both in the methods of placing their goods on the market and of advertising them, and it is thought that the business will develop greatly in the near future.

"American computing scales, cash registers and other specialties have been widely sold in Scotland this year, and the agents say that there is yet a very broad field before them."

American Products in Breslau.

UNITED STATES CONSUL ERNEST A. MAN, at Breslau, Germany, reports that American goods of various kinds seem to be slowly acquiring a market in that region, in spite of the fact that every possible obstacle continues to be placed in the way of their introduction and sale." He continues: "American shoes are beginning to be nearly as well known in Breslau as in Berlin, Dresden, Frankfurt, Munich and other important cities, where they are to be found in stores devoted exclusively to their sale, whereas in Breslau they are still only sold in shops handling other makes of shoes or in connection with men's furnishing goods. While most of the lines of American goods that have made their way into other parts of northern Europe are also to be found, with limitations, in Breslau stores, there is evidently a field for much larger sale of all these wares.

"Among the articles which might be sold in this district at the present time are American door locks intended for front or entrance doors, as, in addition to the old-fashioned locks with their large and cumbersome keys and lack of security withal, they are now introducing here an extra-security lock, said to be on the American system, with a small, flat key, which unites safety with convenience and which in make and finish seems greatly inferior to American locks of the same style. These locks should be mortise locks, as

rim locks are not in general use and should be of moderate price. American office furniture and rocking and easy chairs, many of the latter in the style of what is known as the Morris chair, are to be seen for sale here.

"The sale of American agricultural machinery and implements, while considerable, could undoubtedly be greatly increased in this large and important agricultural district, where so many manufactures of an inferior order finds an excellent market."

New Trade Treaty with France Expected.

THE officials of the United States Embassy at Paris and of the French Ministry of Commerce express satisfaction at the despatches from Washington indicating a disposition to make a new commercial agreement between France and the United States. Negotiations to that end have been in progress since last July, when the French Parliament, without warning, placed a practically prohibitive rate on American pork and salt meat.

During the negotiations an official intimation was given that if the prohibitive rates on American pork were continued President Roosevelt might find it necessary to exercise his authority under the reciprocity agreement of 1898 of suspending the reduced rates which the United States accord to French clarets and other still wines. Under the agreement of 1898 French still wines are admitted into the United States at 35 cents per gallon, which is considerably below the regular rate, but a clause in the agreement gives to the President the right to suspend the reduced rate if any action is taken prejudicial to American trade. It was therefore pointed out to the French Ministry of Commerce that the prohibitive rates on American pork were likely to be considered such a prejudice to American trade as to warrant the President in suspending the privileged tariff granted to French still wines.

The French authorities met the suggestion in a most agreeable and conciliatory spirit. They asked, however, whether, if the low rates on American pork were restored the United States would reduce the rate on French champagne. This was not conceded, as it was claimed that the minimum rate on pork was a matter of right, having existed when the reciprocity agreement of 1898 was signed.

Owing to the friendly attitude of the French authorities throughout the negotiations it is expected that the readmission of American pork may lead to a further agreement on other articles discussed.

American Trade Prospects in France.

AN interesting suggestion as to increasing American commerce abroad is put forward by C. P. H. Nason, the capable and efficient United States Consul at Grenoble, France. Mr. Nason says: "I have often thought as American dentistry has planted itself in European cities and demonstrated the quality of its work by daily practice, so the planting of American stores on a smaller or larger scale with specific American goods—household utensils, furniture, tools, garden and field implements, shoes, threads, tongs, stove handles—scores of things I could name, would demonstrate their ability to 'meet long-felt wants' and assure to their promoters an ever-increasing patronage. Even with French high-tariff restrictions, I believe this could be successfully done, while at the same time it would stimulate native dealers to search after and keep on hand more and more of our goods."

Mr. Nason mentions that among the new buildings and other city improvements of Grenoble during the year just past another "department store" on a large scale, made especially attractive and presenting many modern features, is worthy of notice. While it follows the lines of similar stores in French cities, it is noticeable that its goods, varied as they may be, are yet almost wholly "made in France." Mr. Nason says that it is lacking in a hundred and one commodities which go to make up "all the comforts of home" in the United States. Asked wherein it differed from an American store of the same class, he says: "In its limitations it lacks the product of other countries of the world in general and of those of the United States in particular."

Amity Between Britain and America.

IN an article on "The Progress of the World" in 1903 the *Review of Reviews* has this to say regarding one of the important incidents of the year and its effects: "The settlement of the Alaska boundary question has cleared the way for the consideration of various matters affecting the mutual welfare of Canada and the United States. If there are any unsettled disputes of any nature whatsoever between England and the United States, they are too inconsiderable to be known by the average citizen of either country. Never, indeed, since the revolution of the American colonies has this country been upon terms of such complete amity with the mother country as at the opening of this new year, 1904."

American Museum in Paris.—A cable despatch from Paris tells about the banquet of the American Chamber of Commerce in that city on January 16th and reports that the suggestion made by Mr. Gowdy, the American Consul-General, that the time had come for the establishment of an American museum in Paris, in which should be exhibited American raw materials and manufactured articles for the purpose of demonstrating to the French people the enormous resources of the United States, was received with great enthusiasm.

Steam - ENGINES—Gasoline.

OSCAR SCHMIDT, Jersey City, N.J., U.S.A.

MANUFACTURER OF

MUSICAL INSTRUMENTS.

Special Offer for Export.—An assortment of 39 Instruments for **\$89.40** (£18 13 5) Net.
F. O. B. New York, as follows: All protected by patents.

We will furnish the complete assortment, or any portion of it, at the prices quoted above. Order through any reliable exporter.

White Enamel Refrigerator Co.,

Owners and Manufacturers of

Bohn's Patent Dry Air Syphon System of White Enameled Refrigerators.

The Bohn Dry Air Syphon System insures a low and uniform temperature, ranging from 38 to 48 degrees Fahrenheit. With our Enamel Lining, you need only to wipe the food compartments with a damp cloth to clean perfectly. The only absolutely sanitary refrigerator made.

Adopted and used exclusively by the Pullman Company for all of their Dining and Buffet Cars. Pennsylvania Lines, New York Central, Michigan Southern, Union Pacific, Canadian Pacific and all other railways throughout "the States" and Canada as well as by thousands of homes, hotels and clubs.

For Foreign Markets Only.

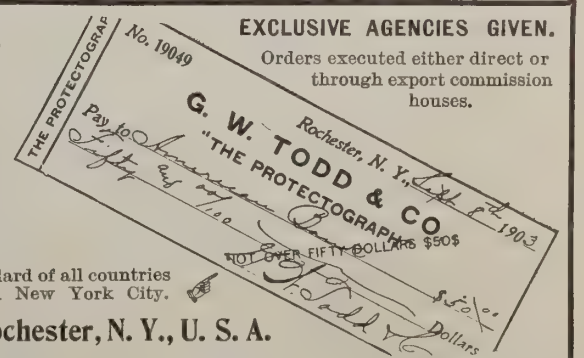

The prices here quoted includes boxing ready for transportation and delivered F. O. B. cars at New York City.

No. 2. Style "A." Panel Door. Price, \$23.00. Outside measurements (inches): Width, 38; depth, 21; height, 44. Weight, boxed, 278 pounds.

No. 3½. Style "D." Panel Doors. Price, \$32.00. Outside measurements (inches); Width, 38; depth, 21; height, 55; weight boxed, 360 pounds.

NOTE.—Orders received direct, or through export commission houses. When ordering through the latter, to avoid errors, please mail us a duplicate of order.

Our forty-page catalogue, illustrating and describing the various styles of White Enamel Refrigerators made by us, mailed postpaid.

Russia and Japan Use American Ships.

SHOULD war eventuate in the Far East between Japan and Russia, the unusual spectacle will be presented of American skill being pitted against itself in modern powerful vessels being lined up against each other by any naval battle that would take place. The newest warships of both nations have been built in the United States. Notable in this class are the Variag of the Russian navy, and the powerful Kasagi of the Japanese navy, both of which "crack" vessels were built in the United States within five years. These two cruisers are of about the same tonnage and speed, and would be pitted against each other. The navies of the world are particularly interested in the prospective war between Japan and Russia, as a naval conflict would bring into action warships of both countries built in the United States. What the result of such a combat on sea would be is problematical.

The Imperial Japanese cruiser Kasagi is the equal in materials and workmanship to vessels of the corresponding type in the United States navy. The armament of the Kasagi is two 8-inch quick-firing rifles, ten 6-inch quick-firing rifles mounted in broadside, with secondary battery of twelve 12-pounder quick-firers and six 2½-pounder Hotchkiss guns. There are five torpedo tubes for 14-inch torpedoes. The vital parts of the Kasagi are protected by a steel deck having a maximum thickness of 4½ inches on the slopes and 1½ inches on the flat, beginning 4 feet below the load-water and rising to a height of 1 foot above it. In no respect of plans, construction or arrangement is the Kasagi excelled by any vessel of her type and class, while but few equal her.

It was in 1893 that Vice-Admiral Nicholas Kāznakoff visited the United States in command of a Russian squadron. During his stay here he thoroughly examined the work in hand for the United States navy, and expressed to the president of one of our shipbuilding companies the opinion that the Imperial Russian Government would be inclined to place orders here for two or more ships upon suitable application. This led to a considerable correspondence between the head of the shipbuilding firm on one hand and Admiral Kaznakoff and other leading spirits in the Russian navy on the other, with the result that at the beginning of 1898 two contracts were signed, one for the construction of a first-class protected cruiser called the Variag and a first-class battleship called the Retvizan.

The Imperial Russian protected cruiser Variag was completed and delivered to the Russian Government in 1900. She went immediately to St. Petersburg upon leaving Philadelphia, and was received by the Emperor and his people with great eclat. The Emperor was so pleased with the cruiser that he selected her to escort the Imperial yacht from St. Petersburg to Cherbourg.

The Variag has a speed of twenty-three knots per hour. The machinery was designed and calculated to develop 20,000 I. H. P., and is capable of doing so if required. The vessel is designed to fulfil the highest requirements of a high-speed protected cruiser, carrying a large battery of quick-firing guns and provided with an unusually large number of water torpedo tubes.

The battery of the ship is as follows: Twelve 6-inch 54-caliber rapid-firing guns, twelve 50-caliber rapid-firing guns and six 3-pounder Hotchkiss guns. The torpedo battery consists of one bow tube, one stern tube and four broadside training tubes. The vessel carries the following armor, all treated by the Krupp process: Main water-line belt for a length equal to two-thirds the length of the vessel and with a thickness of 9 inches. Casement armor, 6 inches in thickness, extends above this to the line of the main deck, and armor of 5 inches extends to the line of the upper deck, protecting the 6-inch guns. All the armor extends for two-thirds the length of the vessel. Forward and abaft these limits the vessel is fitted with nickel-steel armor 2 inches in thickness to the bow and stern, respectively. The amount of coal carried at trial displacement was 1,016 tons, and the coal bunker capacity allows for a radius of action of 8,350 miles at ten knots speed.

Some Comment on Japan's Prestige.

THERE can be no question of the interest that is taken in America in the results of the dispute between Russia and Japan. America has the friendliest feeling for both nations. It is an unquestioned fact that neither nation wishes war unless it must happen to preserve the dignity and rights of one or the other. Without going into the merits of the unfortunate controversy, the following observations in the New York *Tribune* regarding the new progressive Japan will be read with interest:

"By no means the least interesting and auspicious feature of the present controversy in the Far East is the position which Japan occupies in the sight and esteem of the world at large. The prestige which that remarkable nation has gained and holds has probably never been rivalled by that of any other in similar circumstances. Men who are not yet willing to be considered old remember when Japan was scarcely open to the world, and had scarcely begun to emerge from barbarism—when the world generally spoke of Japan much as of Burmah and Zanzibar and the Fiji Islands. Men still young remember when Japan threw off the fetters of mediævalism and adopted a constitutional and representative government. It seems only the other day that extra-territorialism was abolished, and all other discriminations, and Japan was treated as the legal peer of other nations. It was two years ago in January that Great Britain took the unprecedented step of making a treaty of alliance with Japan, treating the latter with respect and esteem similar to that which France pays to Russia in the Dual League, or that which the members of the Triple Alliance pay to each other.

"To-day, then, Japan stands unchallenged among the great powers of the world. She is the peer of any of them in legal standing. In sentiment and sympathy she actually outranks at least one of them. There can, we think, be no doubt that the preponderance of sympathy the world over is with her and against her adversary in the present quarrel. That is to say, Europe and America side with the Asiatic power of the yellow race against a European power largely of the white race. That is an extraordinary state of affairs, but the reason is not difficult to discover. It is partly because Japan is seen to be fighting the battle of civilization and progress. She is contending for the interests of Europe and America, against influences that would impair them. But that is not all. Japan is also seen to be worthy of the esteem she is receiving. That is, perhaps, the dominant feature of the case. In wise statesmanship, in shrewd diplomacy, in generous spirit, in earnest desire for peace with justice and honor, and in intelligent self-control Japan has won the admiration of the world. It is to be doubted if any other nation in similar circumstances has ever acted more creditably."

American Motors in New London Tube.

THE new two-penny tube in London is due to be thrown open on February 1st, and our London readers will know how it works before this paper reaches them. The tunnel is British, of course, but there is so much of the American about it that English-speaking people everywhere, regardless of national affiliations, will watch its operation. The new tube is nearly four miles long and brings a very populous district in touch with London. This tube is a distinct advance on the similar railways already working in London. Some of those who made the official experimental trip last month pronounced it the best underground railway so far constructed in the world.

The tunnels have a 16-foot diameter, as compared with the 11 feet 8 inches of the Central London Railway, and this permits the use of larger rolling stock. The cars are somewhat longer than those in use in other tubes. They are built of teak, with a height of over 12 feet, which makes them roomy and airy. They are, in fact, of equal width with the widest carriage that can be run on any British railway, the bulging sides making for greater comfort. All the seats are crosswise, with a center aisle. There are doors in the center of the cars for emptying and filling with great celerity at the terminals. The stations along the route are roomy, with big lifts and wide terminals. All the structures underground, including even the signalman's cabins, are fireproof. The trains are made up of seven coaches, three of which are motor carriages. One of these is placed in the middle of the train.

"An all-British two-penny tube!" declares the *St. James Gazette*, describing the railway, but, according to a statement issued by the contractors, the Brush Electrical Engineering Company built many of the carriages at their English works. They are supplied with Westinghouse air brakes, and the motors were built by the General Electric Company of America, while the driving system is the Sprague multiple unit.

Our Agricultural Implements in Russia.

THOMAS E. HEENAN, United States Consul at Odessa, says: "The year 1903 has been a very satisfactory one for the sale of agricultural machines and implements. The American articles in this line continue to hold the field and their number is increasing. Harvesters, binders, reapers, mowers, rakes, corn-shellers, etc., have always been in favor in the country and their sale has been large. The American plow has now secured a permanent foothold in Russia, and its future promises to be a very satisfactory one. The sale of garden tools of American make shows an annually increasing market in this country. Tools of various kinds, representing the finer qualities of the American articles, are also found on this market and are meeting with high favor. Knives for harvesters, mowers, reapers, etc., had a very large sale during the present year (1903) as well as in 1902. The American automobile made its debut at Odessa for the first time during the present year and a few machines were sold which have given great satisfaction."

Warlike Countries Buyers in America.

INFORMATION came last month to the United States Treasury of the arrival of large quantities of Japanese gold at the United States port of San Francisco. In nearly all cases this gold has been deposited in the Sub-Treasury at San Francisco and made immediately payable in New York. It is evident to the Treasury authorities that Japan is paying as she goes. About \$5,000,000 in Japanese gold was received in the United States within one fortnight last month to pay for wheat and flour and munitions of war. Russia is also buying heavily in the United States, and this fact is shown by the record of recent exports from this country to Russian ports.

Our Trade with Korea.—Recent United States Government statistics show that the value of American petroleum consumed in Korea in 1901 was over \$300,000; machinery and supplies, \$250,000, and electrical goods and lumber, \$236,000. The trade has since greatly increased, but accurate figures are not available.

MILLS NOVELTY CO.

INCORPORATED.

CAPITAL, \$500,000.00.

CHICAGO, U. S. A.

[Mills Novelty Co.'s Works, Chicago, U. S. A.]

Largest Manufacturers and Exporters
in the world of all kinds of

Coin-Operating Machines.

Our 80-page catalogue, just issued, profusely illustrated, in colors, describing the many styles of **Coin-Operating Machines** made by us, will be mailed post-paid to all parts of the world.]

Nearly all our Coin-Operating Machines can be made to be operated by the coin of any realm.

All machines are boxed ready for steamer, and prices quoted will be f. o. b. cars New York or San Francisco. Orders received through export houses. When ordering through export houses specify **MILLS NOVELTY CO.'S COIN-OPERATING MACHINES**, and to avoid errors, please mail us duplicate of order.

Embossed Metal Ceilings,

SIDE WALLS AND CENTER PIECES.

SPECIAL PRICES FOR EXPORT.

J. H. ELLER & CO.,

CANTON, OHIO, U. S. A.

I. E. PALMER,

Middletown, Conn., U. S. A.

Manufacturer of

Hammocks, Mosquito Nettings and Canopies, Dress Linings, Window Screen Cloth and School Bags.

No. 122E—Size, 35x78 inches, with spreader; assorted colors. Price, \$5.80 (\$1 41) per dozen net.

No. 14SE—Same as above, with addition of pillow and wide valance; assorted colors. Price, \$11.26 (\$2 71) per dozen net.

No. 64SE—Size, 43x82 inches; with pillow, wide valance and spreader; assorted colors. Price, \$26.00 (\$5 81) per dozen net.

No. 64SE—Same as above, except "narrow valance" in place of "wide valance." Price, \$21.50 (\$4 10 0) per dozen net.

Descriptive and Illustrated Catalogues furnished on application.

We manufacture Hammocks of all sizes and prices. The Utopia Hammock is patented in all the large countries of the world.

No. 726—Trapeze with Arawana Hammock. Trapeze to be used with this or any hammock. Price, of trapeze alone, \$19.50 (\$4 20) per dozen net.

No. 44SE—Arawana Hammock (without trapeze); size, 39x81 inches; with spreader, pillow and wide valance; assorted colors. Price, \$20.95 (\$4 21) per dozen net.

No. 72S—Hammock Support with Utopia Hammock. Adjustable support (to be used with this or any other hammock). Price, of support alone, \$45.00 (\$9 61) per dozen net.

No. 687—Utopia Hammock (without support); with spreader, adjustable pillow, wide valance and seat. Price, \$39.90 (\$8 50) per dozen net. Adapted for indoor and outdoor use. Degree of recline easily changed from sitting to sleeping position by extending or contracting the frame.

These prices are NET, free on board New York.

No. 689—Canopy, Umbrella Top; 90 inches high, 9 yards around. Price, \$1.05 (\$0 53) each net.

Plain Mosquito Netting, 70 inches wide, per piece of 8 yards; white, 35¢ (\$0 11); colors, 37¢ (\$0 11) net.

LITTLE'S WONDERFUL COBWEB CARBON PAPERS.

This product is unique in Carbon papers; its discovery an accident; its success immediate. For a long time after its first advent, the tissue paper upon which the carbon is made could not be procured. The mill declared it impossible to duplicate the shipment. The lot previously made was an accident. They had exhausted every facility of their plant to fill the order, with no avail. It looked as though the Cobweb was forever lost. Urged by Mr. Little, continuous experiment was made and finally the net result of a former accident was secured and the stenographic profession permanently enriched by the only carbon paper made that would produce from sixteen to thirty clean, clear-cut impressions at one writing. All machine company's tests for "largest number of copies" use Little's Cobweb Carbon Paper. It is very thin, extremely fervent, does not smut and will not deteriorate, under any ordinary circumstances, in any climate. *Age improves it.* Used and recommended for taking six to sixteen duplicate copies. Made in the usual colors.

Send for Catalogue. Orders received through New York commission houses at export rates.

A. P. LITTLE, Manufacturer Standard Typewriter Supplies, Rochester, N.Y., U. S. A.

COAL TO BE CHEAP AS CLAY.

American Inventor Believes He Has Found a Process to Cheapen Fuel's Cost.

THERE is an old saying that there is nothing new under the sun, but a resident of the State of Indiana, U. S. A., has undertaken to make artificial coal, using clay, or ordinary earth, as a substitute for coal. Our readers will be skeptical, as we are, regarding the discovery, but the following account, published in an American newspaper of influence and standing, will be found interesting: "Common dirt—earth of any kind—forms the base of the artificial fuel, which is cheaper and better than any heretofore used, either natural or artificial. Many men of scientific learning have investigated the invention, and all unite in saying that this inventor has undoubtedly found a substitute for coal. While working out the problem of rubber tires for vehicles he discovered a chemical action that gave him the idea of trying to invent a process by which he might manufacture artificial fuel.

"The artificial fuel produces a more intense heat and is more lasting than the natural coal. It is attended by slight waste, a fine white substance being the only residue. It is smokeless, generates no gas, and, what is most gratifying, can be produced at less cost than the mere primary expense of carrying the natural product to the mouth of the mine.

"The failures of the past in the attempt to produce an artificial fuel may be attributed to the fact of the inability of inventive genius to furnish a quantitatively preponderant base that, in combustion, would not too readily sacrifice its chemical coagents. This much-coveted base is the eminent feature of this man's invention. For each ton of fuel he creates he employs 1,800 pounds of solid and 200 pounds of chemicals. His formula is fully protected by patents.

"The fuel is composed of any adhesive soil, or clay, compounded with chemicals, and can be manufactured either soft or hard, to meet the consumer's demand, the soft burning the more readily. The softer substance resembles gunpowder. The color is that of the natural coal, but dull, having no gloss whatever. The color is intensified by heating, by which action it is hardened. The hard coal is a jet black in color. It may be rendered so hard as to ring like steel when struck. Its density depends on the pressure brought to bear on it in the process of manufacture.

"When first ignited a tiny yellow flame is produced. It soon forms a bed of incandescent coal, from which a faint bluish blaze emanates. If the fuel is formed in blocks or pencils it retains its form until the mass is reduced to white ashes. As it contains no fuel gas it is perfectly safe. That this artificial has more than double the heat-producing capacity of the natural coal has been proved by various tests."

As to this discovery we will advise our readers further when the new fuel has demonstrated its practical value; if it is not, as we suspect, of less merit than our contemporary apparently believes.

Our Shoes Meet with Favor in Austria.

AMERICAN shoes are growing in popularity in the foreign markets. Austria likes them, as well as other countries, and W. A. Rublee, the

United States Consul-General at Vienna, has this to say about the development of sentiment in favor of American footwear: "The opening within a few weeks of a large retail shoe store in the center of Vienna's shopping district, where only American-made shoes will be sold, is a significant tribute to the superiority of American shoes. Shoemaking is one of the Austrian industries which has always flourished and which enjoys a considerable export trade. Sales of American shoes in the Austrian markets have, therefore, met with many difficulties, and there has been until recently a more or less general belief among Austrians that competition with the Austrian product in the home market could not be successful, both on account of the good quality and the cheapness of the home-made shoes. Besides, public opinion and Government influence favor protecting the home industry.

"The growing demand for American-made shoes which has now resulted in the establishment of a shoe store in which American shoes are to be sold exclusively proves conclusively, however, that American footgear has made its way into public favor strictly on its merits, and that the trade is likely to have a steady increase in the future. American shoes have been sold in Vienna during the last few years in small quantities with gradually increasing success, being handled by a number of stores side by side with Austrian shoes; but up to the present time there has been no store where there was a large stock to select from, and the test of the market has, therefore, not been wholly satisfactory.

"The project to do business on a larger scale has been undertaken by the proprietors of a leading Viennese shoe store who have during the last two years bought small consignments of American shoes experimentally. They have now become satisfied that there is a permanent and growing demand for these shoes that warrants catering to the wants of Viennese buyers on a more extensive scale, and they have decided to open a separate store to be known as the American Shoe Store of Vienna. A large store has been rented for this purpose, and the first order to American manufacturers is for 3,000 pairs of shoes. The men back of this enterprise are successful Viennese dealers in shoes, thoroughly in touch with the market, and they consider the success of their new venture assured. Their customers to whom they have sold Ameri-

can shoes are so pleased that they will never again wear shoes of any other make.

"American shoes impress Austrian buyers as possessing far greater durability, superior comfort and better workmanship. They are more expensive than the Austrian article, but customers are satisfied to pay more, as they consider them worth more. The Austrian shoes, though hand-made, are admittedly inferior to the American machine-made shoes."

Consul-General Rublee also reports an increased demand in Austria for American shoemaking machinery.

Peculiarities of the Playing-Card Industry.

ON my friend Raymond's desk was a deck of playing-cards. There was nothing unusual about that, for there are always playing-cards on Raymond's desk. Not that he is given to interspersing the day's work with an occasional hand at poker or anything else, but because Raymond is interested in a company that manufactures most of the playing-cards in the world.

This particular deck of cards had very beautiful backs and gold edges. I picked it up to examine it more carefully, and turned the pack over to look at the faces of the cards. The first I saw was the ace of spades. So was the second. I "riffled" them and then rubbed my eyes. They were all aces of spades. I looked at Raymond in surprise.

"What sort of a cold deck is this?" I asked.

"Nothing cold about it," he replied. "That is simply a lot of extra aces, left over from samples of decks we have just sent to France."

"But don't they use the ace of spades in French card games?" I feebly inquired.

"Oh, yes," said Raymond, "but the Government makes that card."

"The French Government," he continued, "controls the monopoly in the manufacture of many things, such as tobacco, wines, etc., exercising a sort of overseership in their making. This extends to playing-cards. Every pack issued in France must have the imprint of the Government. But the Government does not care to attend to the making of the whole pack, as it would entail the erection of a bigger plant than it wishes to handle. So the contract is let to us. We manufacture the cards and send them over to France, but the ace of spades is manufactured in France and put into every deck under Government supervision, the pack being then sealed. This leaves us thousands of aces of spades every year, which we use as samples. We could, of course, print a deck with only fifty-one cards, but the ace of spades is as good for advertising purposes as any other card, so we strike it off and keep it out of the orders for the French Government.

"In this connection we manufacture nearly all the cards that are used in Germany, also, and practically furnish all of Europe with its gambling material. Every card used at Monte Carlo comes from our factories, so that even if Americans are among the victims of that paradise of gambling they can glean some satisfaction in knowing that they have lost by Yankee cards, at any rate.

"The cards for every European country are a little different from those of any other, not in the general arrangement of the spots or the number in a deck, but in the designs. It would make a German nervous to play with French cards, for instance.

"Our manufacturers, however, are not confined to America and Europe, as a little instance will prove to you. Here is a pack of Japanese cards. It was brought to me by a friend who was traveling in the Orient and thought she would like to bring me some little souvenir. Knowing of my connection with the playing-card industry, she fancied that Japanese playing-cards would be acceptable, so she bought these in Tokio. One evening shortly after her return she came to the house and presented me with these. I thanked her. She commented on how different they were from American cards and asked me if I had ever seen any before. I hated to shatter her idea that the present was a great surprise to me, but I had to. Opening the package I found one card and held it up for her to look at.

"In a prominent place in English characters she saw the words, 'Manufactured by So-and-So Playing-Card Company, America.'"—*New York World*.

Cotton Export Record Broken.—"King Cotton" made its greatest record in American export figures of the calendar year 1903. From 1883 to 1903 cotton exports averaged a little more than \$750,000 a day. In 1903 they averaged more than \$1,000,000 a day; in the last three months of 1903 they averaged more than \$2,000,000 a day, and in the closing month of the year nearly \$2,500,000 a day.

French Paper Mill Uses American Invention.—C. P. H. Nason, United States Consul at Grenoble, France, writes: "As showing a tendency in this locality to accept any marked American improvement, a plant for the making of paper-mill machinery—at Rives—has recently contracted with an American inventor for the control of a patent covering a machine for the quicker and more economical drying of paper."

Folding Hat Box.—An American has recently invented a hat box of the type of the collapsible drinking cup which has been in evidence for so many years. The sections are all united by a flexible cloth lining, which is drawn tightly from top to bottom when the box is expanded, and lies loosely between the sections when they are collapsed.

De Laval Cream Separators.

Immediate and absolutely complete separation of cream from milk by machinery.

500,000 Machines in Use throughout the Dairy World.

A saving of 10 to 25 per cent. in any climate, and 25 to 100 per cent. in warm countries.

Increased Quantity and Improved Quality of Butter and Cream.

Machines Simple, Durable and Easily Operated.

Satisfaction Guaranteed.

Prices, \$50 to \$225.

Portable Galvanized Iron Ovens.

We make the kind the United States Government buys and which is being adopted by Foreign Governments as well as by those interested in the economical baking of the products of flour, meat and vegetables. Either Coal, Wood, Natural or Artificial Gas can be utilized as Fuel. Used by Bakers, Hotels, Steamships, Restaurants, Confectioners, Colleges, Asylums, Private Residences and in Japaning, Enameling and Core Baking.

FOR FOREIGN MARKETS ONLY:

Upon receipt of price (as below) in U.S. Gold or its equivalent, we will deliver F. O. B. Cars New York, boxed ready for steamer, as follows:

PORTABLE OVEN No. 114—Has three shelves (28x20 inches each shelf) holding at one baking Thirty Large Loaves of Bread. Weight, boxed, 300 pounds. Price.....\$ 37.50

PORTABLE OVEN No. 116—Has five shelves (33x20 inches each shelf) holding at one baking Sixty Large Loaves of Bread. Weight, boxed, 500 pounds. Price.....\$ 62.50

PORTABLE OVEN No. 119—Has ten shelves (33x20 inches each shelf) holding at one baking One Hundred and Sixty Large Loaves of Bread. Weight, boxed, 1000 pounds. Price, \$125.00

Orders received direct or through export houses. When ordering through export houses, to avoid errors, please mail us a duplicate of order.

Portable Oven No. 116—Open.

ST. LOUIS, MO., U. S. A.

Will Be the Biggest Fighting Ships in the World.

A WRITER in the St. Louis *Globe-Democrat* tells an interesting story about two coming monarchs of the sea that are being built for the American navy. These vessels are the new 16,000-ton battleships Connecticut and Louisiana. They are the largest fighting vessels this Government has ever built, and will exhibit several entirely new features of construction and armament. They will be clad in a complete coat of steel, instead of depending merely upon an armor belt for their vitals; they will carry rapid-fire weapons of heavy caliber and pattern hitherto unknown, and they will utilize electricity for aiming as well as firing their guns.

The armor of the Connecticut—the vessels are twins, exactly alike—will cost \$1,500,000, and she will carry \$1,000,000 worth of guns. Her steel protection, instead of being concentrated in a water-line belt amidships, leaving the ends of the vessel exposed, after the method hitherto adopted, will extend from bow to stern, and above the main water-line belt will be three thinner belts—the lower casemate, upper casemate and superstructure armor.

The two battleships will be the most formidable fighting vessels on the seas. Each of them will have four 12-inch guns in the turrets, which will throw projectiles weighing 850 pounds with a velocity of 2,800 feet, or a little over half a mile a second. This velocity is one-fourth greater than was obtained with guns of the same caliber on the old Iowa, the improvement being due in part to the new smokeless powder, but mainly to an enlargement of the powder chamber, which is thus enabled to hold a larger quantity of the explosive.

The guns next in size will be 7-inch—a caliber unknown hitherto in our service. Taking the place of the 8-inch cannon mounted on the Indiana and other battleships, they will be much more manageable and at least equally effective. They will be of the rapid-fire pattern, delivering a stream of projectiles weighing 165 pounds, each of which will carry a bursting charge of 13 pounds of black powder. These explosive shells, for which armor-piercing projectiles may be substituted when desired, will travel at a rate of 3,000 feet a second, and the damage done by them will be something frightful.

The explosion of such enormous charges of gunpowder as are required for these huge weapons—the 7-inch caliber takes 101 pounds for each shot—produces tremendous shocks aboard ship, and the 12-inch guns of the Connecticut and Louisiana will be made 5 feet longer than ordinary, so that their muzzles shall project far beyond the vessel's side when trained abeam. Thus the blast from them will be less likely to affect the smaller cannon on the deck below. All of the new projectiles, by the way, are made with thicker walls, to resist the higher pressure of explosion, and many of the older shells in stock have to be thrown away because too thin.

Hitherto most of the guns of the secondary batteries have been 3-pounders and 6-pounders, but on the two new battleships these will be replaced by weapons of 3-inch caliber, rapid-fire, discharging 14-pound shells. The latter can be fired nearly as fast as the 3-pounders, and they will inflict vastly more damage. Twenty of them will be carried by the Connecticut, and it is easy to imagine what tremendous execution they will be capable of, delivering a veritable hail of bursting projectiles.

The new battleships will be provided with a new kind of shell which, while effective as an armor-piercer, contains a large bursting charge of gunpowder. Up to now the armor-piercing projectile, utilized exclusively for that purpose, has been solid and non-explosive, but this novel agent of mischief is capable of passing unbroken through armor plate a foot thick, thereupon bursting and doing an amount of damage well calculated to demoralize the enemy. Such a shell, landing in the engine-room, would be likely to put the machinery out of business.

Electricity will be employed on the Connecticut and Louisiana for purposes to which it has not hitherto been applied. There will be electric ammunition conveyers, and it is probable that the larger guns will be aimed as well as discharged by electricity. In a seaway the roll of a ship interferes a good deal with accurate marksmanship, and it is now an accepted theory that, in order to do satisfactory shooting, there should be continuous aim—that is to say, the guns should be kept steadily pointed at the target, no matter how the vessel moves. One method of doing this is to keep the weapon horizontal by an automatically controlled electric motor.

To train American gun-pointers in the business of hitting the target vast sums of money are being expended by the Navy Department, three battleships of the North Atlantic fleet having used up a quarter of a million dollars' worth of ammunition within twelve months. For this purpose smokeless powder is employed almost exclusively; the Government has not made or bought any black powder since the Spanish war, except for loading explosive shells and making fuses. From 2,000 to 3,000 pounds of smokeless powder are turned out every day at the factory at Indian Head, on the Potomac River, near the capital city of Washington, and enough, in addition, is purchased from private concerns to raise the supply to 10,000 pounds a day.

The Government factory at Indian Head comprises twenty-eight buildings, which are scattered widely over about 300 acres of ground, so that the destruction of one of them may not affect the others. In July of last year one of the powder houses was struck by lightning and wiped out. It is not known what was the cause of a similar catastrophe at Mare Island, California, on the Pacific Ocean, not long previously, where 300 tons of smokeless powder blew up.

Smokeless powder is likely to decompose and deteriorate—a trouble against

which the United States Navy Department has to be constantly on its guard. In order to detect such deterioration when it occurs the curious device has been adopted of mixing with portions of the explosive a small quantity of a coal tar coloring called "rosaniline," which imparts to it a deep carmine hue. If decomposition occurs the powder thus treated loses its color.

For practice in shooting at night the United States Navy Department has been using recently a new contrivance called a "tracer"—a small attachment to the fuse of a shell containing a brilliantly burning composition, by which the projectile is illuminated during its flight through the air. Thus the gun-pointer following the shell with his eye, is enabled to watch the path it takes. Some of our war vessels have been supplied with these tracers for experimental use at sea.

The United States Government has now twenty-five war vessels building, including nine battleships. Their armament will cost \$25,000,000, and the armor for them will come to another \$25,000,000.

Near the Limit in Size of Big Ships.

A WRITER in the *Engineering News*, in discussing the question as to where the building of big ships will end, sustains the view taken in recent issues of THE AMERICAN EXPORTER and says: "Various authorities in engineering have attempted to predict the future rate of progress in marine construction, and the fact that at a single stroke 3,000 tons have been added to the size of the record vessel will doubtless be made much of. Nevertheless, there is much reason to believe that we are near the limit in size of ships, for the present at least, and there may even be a reaction. The size of ships is governed by the depth of the channel entrances to seaports, and these latest huge vessels draw so much water that they can only enter a few ports and at only a very few can cargo or passengers sufficient to fill them be secured.

"Besides this, it will readily be concluded that the reason why bigger and bigger ships have been built is purely a commercial one. The question 'Will it pay?' is the question to be answered in determining whether the size of ships is to go on increasing, and if so to what extent. It will be readily granted that a ship of 10,000 tons can be operated more cheaply per ton of freight carried than one of 5,000 tons, provided the volume of traffic is sufficient to keep her employed, and provided, also, that cargo-handling appliances are such as to keep down delays in port. But, granting this, it will readily be seen that there is not a like saving to be made in again doubling the size and going from 10,000 to 20,000 tons. Perhaps under certain circumstances the 20,000-ton vessel may be worth while, but even if this is the case it does not follow that a still bigger vessel would be still more profitable. It must be remembered that these very large vessels cost considerably more to build per ton of freight capacity than vessels of moderate size."

Unique Features of a World's Fair Exhibit.

THE lumbermen of the United States have a club called the Hoo-Hoo, which is famous for doing unusual things. Its members have decided to have a clubhouse for use at the American World's Fair this year. The house of Hoo-Hoo, as it will be called, will be erected almost in the center of the Exposition grounds, about 300 feet from the Fine Arts Building. It will be of the bungalow type of architecture, built entirely of wood, in order to show the possibilities of the forest products of the United States. It will be 123 by 97, with spacious veranda extending around the entire structure, a special feature of this veranda being that access will be possible into every room by means of large French windows.

The building will contain an office, check-room, telephone booths, large rotunda with magnificent stairway leading to the second floor, and an auditorium with a seating capacity of 400. This room will be beautifully finished in mission oak and will be used for holding lumber conventions, concatenations and as a banquet hall.

There will be six luxurious lounging and writing rooms, equipped with every convenience, for the members of the club, one-half of the building being devoted to the ladies and the other to the men. A commodious reception room with large fireplaces, a retiring room, etc., will be especially fitted up for the ladies. One of the main features will be a newspaper room, arranged in an artistic manner, with panels of possibly thirty-five woods, showing a harmonious blending of colors.

The building will be wainscoted throughout, each room being finished in a different kind of wood, while the walls and ceilings will be handsomely decorated and rich colored draperies and rugs will be used for adornment. A special feature of the furniture will be a color scheme, including the hangings and decorations. The various lumber manufacturing associations of the United States will finish one or more of these rooms, each in the particular lumber in which they are interested.

Will Handle 96,000 Pounds of Steam an Hour.—The steam power plant of the St. Louis Exposition, now being built by Westinghouse, Church, Kerr & Co., will be fitted with two large central condensing units, each consisting of a 40-inch elevated condenser capable of handling 96,000 pounds of steam per hour. These condensers are being built by Henry R. Worthington, of New York City, who will supply centrifugal pumps for handling the circulating water.

Biggest Photograph Is Taken for American Exposition.

THE largest photograph ever taken in the world has just been produced for exhibition at the American World's Fair this year. While the feat is of no value, from the standpoint of international trade, yet it shows the advances made in this branch of an important art industry. The photograph covers 195 square feet of space. In point of size alone this photograph breaks all previous records with a very good margin to spare. Apart from that the photograph has been pronounced one of the most beautiful and perfect ever developed and printed. The toning and fixing of the photograph, which is in one piece and measures 39 by 5 feet, was a gigantic task, which every photographer, both amateur and professional, will readily appreciate. The average photograph is toned and fixed in a bath about the size of an ordinary soup plate. This record-breaking photo required three specially constructed baths, each one measuring 45 feet long, 6 feet wide and 3 feet deep, and containing sufficient solution to "tone" thousands and thousands of photographs of ordinary dimensions.

The scene selected for the photograph embraces the beautiful Bay of Naples. The camera was mounted on the battlements of the Castle of San Martino, which looks down on the city of Naples, hundreds of feet below. Miles away in the distance on the left Vesuvius looms up impressively. In the enormous width of the photograph, 39 feet, the whole panorama of Vesuvius and the city of Naples is spread out with wonderful verisimilitude before the spectator. When the original negatives for the photograph were taken plates 9 by 11 inches were used. Each of these small negatives embraced a certain portion of the entire scene contained in the completed panoramic photograph for the World's Fair. To produce the entire photograph it was necessary to piece the small negatives together, fitting them in exactly where they belonged, and then printing an enlarged copy by the method of enlarging familiar to all photographers.

Twenty men were required to complete this one photograph. They included carpenters, chemists, photographers, surveyors and artists. The carpenters built the enormous baths in which the photograph was to be chemically treated. The chemists mixed up the extra large doses of developing, toning and fixing solutions required. The photographers attended to the actual photographing, the enlarging and printing. The surveyors marked off the territory each 11 by 9 plate was to cover, so that there would be no danger that any part of the picture would be missing when the time came for putting the completed photograph together. The artists were there to add a few finishing touches to the photograph, although strange as it may seem, the huge picture came out so sharply and clearly that there were very few blurs to be smoothed over or indistinct corners to be strengthened with a little line or dab of paint by the touching-up artist.

Probably the most interesting features of the entire production of the enormous photograph was the developing of the enlarged print. This was made in one piece on a strip of specially made photo printing paper 40 feet long and 6 feet wide. The printing was done on a dark night, and in the open air by artificial light and then the print was reeled around a big wheel 15 feet in diameter for the purpose of being developed. This was an exceedingly delicate operation. The developing solution was carefully and evenly applied while a man perched on a ladder at the top of the wheel hosed the huge print in order to retain local development. Other expert photographers examined the print as the wheel revolved slowly and treated other parts of the picture, which required forcing with a sponge filled with developer. After the print had been satisfactorily developed, it was taken off the wheel and passed into the toning and fixing baths, where the print was chemically treated to preserve it from fading.

Reversible Turbines Suggested for Autos.

A CORRESPONDENT at St. Louis, U. S. A., sends to the *Motor Age* a suggestion regarding the applicability of turbines for use in the propulsion of automobiles. This is the first suggestion of the kind that we have seen, and some extracts from the correspondent's letter will be found interesting: "The turbine should form an ideal motor for automobiles, inasmuch as it possesses but a single moving element—the disk carrying the inclined vanes—and thereby doing away with all vibration, such as possessed by the reciprocating steam or gas motor. Furthermore, the turbine has proved itself to be one of the most economical machines for the production of power. Turbines are now in use producing power at much less cost per horse-power than that of the most economical reciprocating steam engine.

"One of the greatest drawbacks of turbines is their high rotative speed, as many of them make from 10,000 to 30,000 revolutions per minute, and it is necessary to reduce this speed to something like 100 revolutions per minute in order to successfully apply the turbine to an automobile. Another drawback has been the fact that, like the ordinary engine, the usual steam turbine has but a single main shaft. The writer has devised a new form of simple turbine, which may be driven by steam, compressed air or other gas."

The correspondent gives an illustration of his device. One drawback to the turbine has been the fact that it could not be reversed. The turbine shown by the St. Louis man obviates that objection and is readily reversible, which is of more importance than he seems to realize. Regarding this he says:

"One main shaft has fixed upon its inner end a disk provided with a series of concentric rows of inclined blades, and this disk is caused to rotate in a given direction by the discharge of steam upon its inclined blades. Another

disk is fixed upon the inner end of the opposite shaft, and is adapted to be driven in an opposite direction from that of the first disk by means of steam directed against its blades. In order to reverse the turbine it will only be necessary to shut off the supply of steam from the peripheral jets and cause the steam to enter the inner jets, when the steam will pass outwardly and impinge upon all of the blades of both disks, and finally make its exit through the exhaust."

The St. Louis man, whose name is John C. Higdon, has made an important discovery, apparently, unless some of the turbine inventors have forestalled him, of which fact we have not been advised.

Recipe for a Successful American.

SIDE-LIGHTS on the qualities that go to make a successful American, as well as the possibilities that are encountered every day in the New World, are given in an article in the St. Louis *Globe-Democrat* concerning a prominent merchant of that city. The paper calls him a "merchant king," but Murray Carleton, whose life is narrated, would doubtless resent the application of the title, for we have no kings in the United States, at least by title. Mr. Carleton began life as a common ordinary printer's devil in a little country newspaper office at \$3 a week, and now a merchant of more than ordinary wealth and influence. During the intervening forty years he has had some experiences which any one would expect him to have had. Some extracts from the *Globe-Democrat's* article about him are interesting:

"Mr. Carleton is, above all things else, a religious man, who earnestly endeavors, so far as may be possible, to carry the principles of his religious belief into his daily life, and no one who is brought in contact with him for even a brief space of time can fail to feel that they are in the presence of a man honest and sincere to the core and ever trying to do just what is right toward all. Mr. Carleton does not talk religion; he does not preach morals; he merely gives the force of example to his own beliefs and lets it go at that.

"In his business Mr. Carleton is methodic to the extreme, and with his many diversified interests he must necessarily be so, for every minute of his working day must be made to yield seventy-five seconds of labor. His great mercantile establishment occupies by far the greater part of his time and interest, though the ramifications of his fortune have taken unto themselves so many paths that his time at the store is frequently broken into by their demands. At the store he will not think of anything else but the commercial side of his life, and when he devotes an hour to something else the mercantile establishment is dismissed from his mind altogether."

The story of his life is given in full, but the following epigrams summarize success as seen and won by him: "Success is the handmaiden of thrift and industry; have a definite ambition if you would avoid wasted energy; bad habits and bad company will undermine any man's chances in life; parents should inculcate a Christian life in their children by example; the child that has been properly trained seldom goes wrong; saloon companions may be good fellows, but hardly ever good friends; energy and perseverance are sometimes better than ability; there is no excuse for a lack of education; self-instruction is always possible and ever obtainable; a business house never fails to reward the attentive employee; the successful man, if he would remain successful, must keep hard at work; system and order facilitate the transaction of business."

Secures Safety to Ships at Sea.

ONE of the fast trans-Atlantic steamships has recently been equipped with an automatic device which robs ocean voyages of danger. Practical tests have been made, and it has been found easy to close the bulkheads by hydraulic pressure, operated from the bridge of the steamship. Pressure is supplied to all the vertical sliding doors by a main running the whole length of the ship, and which is in communication with four steam hydraulic accumulators which are of sufficient capacity when fully charged to supply a pressure of 500 to 700 pounds per square inch. They can close the twenty-three bulkhead doors of the ship in question in from ten to fifteen seconds.

As the accumulators and the hydraulic pump which supplies them are all above the water-mark, they would still be able to work if water got into the hold. A branch of the pressure main rises to the bridge, and the pressure can there be turned by means of a distribution box into either of two smaller pilot mains running the whole length of the ship, one for operating a controlling valve at each door, to close the door, and the other to open it.

In addition to the attachment on the bridge for closing the doors two other means are provided for cases of emergency. Should an explosion occur in the engine-room and steam fill the compartment, by turning down a lever which is connected with the controlling valve the door of the compartment will close and prevent the steam from filling the whole ship. Or should a leak start in any way in the hold of the ship the doors will close as soon as the water rises two feet above the bilge keel.

A warning that the doors are to be closed is given to the men who may be in the hold by means of a gong above each door, which is worked from the bridge, and which has to be sounded for twenty seconds before the door can be closed. The warning is also necessary to allow the men in the stoke-hole to get out of the way any coal which may be lying in the doorway, so that that door may not meet any obstruction. By means of a handle at the side of the door a man caught in a compartment may reverse the hydraulic pressure and open the door, which again will close automatically.

CARY'S UNIVERSAL BOX STRAPPING

Made of soft steel through which nails can be easily driven.

Put up in coils of 300 feet and packed 20 coils in a case.

Patented
in All
Countries.

Made in four widths, viz.:
 $\frac{1}{2}$, $\frac{3}{8}$, $\frac{3}{4}$ and 1 inch.

PAT. MARCH 12 and SEPT. 24, '95.

Before Using
SMOOTH-ON Castings.

After Using
SMOOTH-ON Castings.

In ordinary foundry practice many iron castings are rejected which could as well be saved. Their strength is not affected by blemishes; the only reason for dumping them on the scrap heap is their appearance.

SMOOTH-ON is not a mere filling. It is a dry, metallic composition, which, upon being mixed with water, becomes a hard metallic iron that is insoluble in water, petroleum or other oils; that will stand an intense heat; and the expansion and contraction being the same as iron is why it is sometimes called Magic iron. When applied to a blemish in a casting by a skilled mechanic, the blemish is removed.

Write for our 60-page Illustrated Book, telling about the different
Smooth-On Cements and their uses. Sent free.

SMOOTH-ON MFG. CO.

572-574 Communipaw Ave., Jersey City, N. J., U. S. A.

The Handy Fruit and Vegetable Slicer

The most interesting kitchen utensil ever invented. It slices every kind of fruit or vegetable into an infinite variety of unique and fancy designs, making an entirely new, novel and delicious product.

Is invaluable for making delicate salads, garnishings, etc. Makes Juliennes ten times as fast as by the ordinary method and is the only utensil that will produce Lattice Potatoes. Is extremely simple to operate and sells rapidly wherever shown.

\$16⁵⁰ Upon receipt of SIXTEEN and 50-100 DOLLARS
in U. S. Gold or its equivalent, we will deliver
boxed, ready for steamer, F. O. B. cars New York, one gross [144]
No. 6 X SLICERS, for Export only. Weight boxed,
120 lbs.

NOTE.—To facilitate our rapidly increasing export trade we
desire to arrange with one responsible business house in each
trade center of the world, to handle our NO. 6 X SLICERS and
other specialties manufactured by us.

LATTICE POTATOES

Increased Use of Farm Telephones.

A NEW American industry—the manufacture of farm telephones—has sprung into existence in the last few years, and supports already a number of surprisingly large factories. Farm telephone lines are being extended through the country at a remarkable rate, and it will not be many years until every progressive farmer will have his telephone, which he can use to talk anywhere in the United States. The spread of telephony, which followed the running out of the fundamental telephone patents in this country, has had many striking developments, but none more remarkable than those which have given every farmer in the land the chance to rig up a telephone and thus put himself in direct touch with the outer world. The ubiquitous trolley, running out into the rural regions from the nearest urban centers, has done much to change the conditions of rural and agricultural life; but over and above all, the telephone is proving the instrumentality of what is, as a matter of fact, a new civilization.

Only those who have traveled of late through the rural parts of the great Middle States and of those in the Northwest can have the remotest idea of the manner in which, finding the telephone available and cheap, the farmer has seized upon it with avidity and connected himself up with some cooperative system in his own neighborhood, or again, with bolder effort, has pushed out and joined his own line with the network of some adjoining village. The cooperative principle has in this way received a new and striking exemplification, while the economic outcomes, even at this early stage, are so wide-reaching that it is hard to determine just where the effects of this change will stop.

It is estimated that during the last five years telephones have been put into nearly half a million rural homes. The farmer finds that with the telephone he can keep in touch with the market, selling his produce or live stock when quotations are the most favorable. By sparing himself and his help useless trips back and forth for the purpose of delivering his products, or of ascertaining the status of the market, he now saves a vast amount of time in the course of the year. When he is assured by information over the telephone that he can sell to advantage he loads up his wagon, and not till then.

As illustrating the advantage of keeping in telephone touch with the market, an incident in last year's transactions in broom-corn in Illinois is related by the *New York Sun*. A prospective rise in the market was preceded by great activity on the part of the brokers. Buyers from the outside began to clean up the broom-corn at \$60 a ton, when a telephone manager called up the farmers on his system and told them the market was rapidly rising. The result was that before the season ended they got \$240 a ton for their crop. One farmer reports that in addition to getting nearly double the usual work out of his teams, through their being saved futile trips to market, he has been enabled to do away with the hire of two men, as he could spend more time on his farm and save the diminished output of the hands at work in his absence. Another farmer saved all his buildings by being able to summon help quickly from a nearby town, and also from his neighbors when a fire broke out. Still another, by getting a physician promptly, saved the life of his only son, when the delay of half an hour would have been fatal.

An innovation in the use of the telephone which promises to be the vogue is already very popular. The local grocer or butcher, realizing that time is money, pays for the monthly rent of the telephone of any of his customers who spend \$25 at his store during the month, or makes a corresponding discount for a smaller expenditure. He finds that in the increased amount of business coming through the greater ease of transmitting orders, and the reduction in his staff of order men, he can well afford to throw in the telephone service, which furthermore becomes a splendid advertisement for his store.

In the early days of the rural telephone the farmers were content to utilize their fence wires for intercommunication, and in many districts, particularly in the Western States, this method so reduced the cost of installation as to enable many communities to have a tolerably effective service, which otherwise would have had to go without any. But the farmers are becoming more fastidious. They now want good service, and they are getting it.

The systems employed range from a single line, with from three or four to a dozen instruments connected, to comprehensive systems covering entire counties and having hundreds of patrons. For instance, in Geauga County, O., near Cleveland, where there is a population of about 14,000, there are over 1,000 patrons, the number in each township ranging from fifty to nearly four hundred. Great attention is paid to toll service, and the best construction and apparatus are insisted on, as being in the long run the most economical.

An example of the village and rural exchange is New Augusta, Ind., with seventy-five subscribers, fifty of whom are farmers, the most distant being about seven miles. When a single neighborhood line with a few instruments attached is desired, a switchboard is not necessary. The subscribers signal each other direct by giving different combinations of rings.

So easy has the organization of rural telephone systems become that it is safe to predict that within a very few years the majority of the 4,000,000 farmers said to be yet unprovided with telephone service will have followed the example of their more enterprising brethren and brought themselves within touch of civilization. If any community wishes to install a system, no matter how limited, it has only to communicate with a reputable installation firm to receive the fullest and the clearest instructions as to how to go about it.

A favorite method of organizing is for the farmers to form partnerships

or cooperative (mutual) companies for the furnishing of service only to the locality in which the subscribers live. Sometimes the service is furnished by nearby telephone exchanges running lines into the rural districts.

To Save Automobilists from Dust Discomfort.

RIDERS in autocars everywhere will be interested in an American invention to do away with the annoyance and discomfort which all have experienced while traveling on dusty roads by the dust which is stirred up by the car and surges over the top of the rear end of the vehicle. The car in its forward movement, especially if it is moving rapidly, creates air currents beneath it which stir up the dust, and it also creates behind it a partial vacuum, says the *Philadelphia Record*. The dust-laden air from beneath the car rushes up behind to fill this partial vacuum, and, as a result, deposits or almost throws the dust over the rear top edge into the car and upon the occupants. To prevent this a shield has been extended out behind the car, but such shield is only a makeshift and is more or less unsightly on a touring car of the tonneau type. A Cleveland (U. S. A.) inventor, after studying the problem, discovered that by controlling the air currents thus formed they could be deflected in such a manner as to break up and interfere with the objectionable dust-laden currents. To accomplish this, he uses a shield, preferably a thin sheet of metal, painted to correspond with the tonneau finish, which extends from the side of the car well to the rear, terminating just at the edge of the rear door. The air currents which flow into the front ends of these conduits are deflected and discharged across the rear end of the car in a zone with the upper edge. The inventor explains that as this air, taken from a considerable distance above the ground and thus free from dust, is discharged from the rear of these channels, or air conduits, it creates a partial vacuum behind the car, and this zone interferes with the usual sudden uprush of dust-laden air, which thus checked is prevented from flowing over the rear edge of the car.

New Apparatus to Prevent Shipwrecks.

THE cause of three-fourths of the shipwrecks and loss of life at sea seems about to be removed, according to a writer in a recent issue of *Collier's Weekly*. It is not a wire or even the air, but the water this time that is used to transmit sound vibrations. For some weeks there has been installed on the steamers of the Metropolitan Company of Boston an apparatus which may yet make it possible for the vessels beating about the coast in a storm to know where the rocks and shoals are when the fog will not permit the light to be seen and the noise of the wind drowns the sound of the bell-buoy or the siren; for a battleship to know of the approach of a submarine and a fishing-smack of the approach of a liner off the Banks of Newfoundland.

The apparatus is extremely simple. It amounts to nothing more or less than ringing a bell under water, which the pilot or captain can hear telephonically. Screwed on both sides of the vessel's hull are two receivers, which are connected by wires with the wheel-house. These receive the vibrations from the bell hanging in the water on the side of the lightship. The navigator has only to put the ear-piece to his ear and ascertain on which side the vibrations are the louder in order to know the direction of the lighthouse and his own position in the fog with comparative accuracy.

For fishing vessels a ball receiver has been provided, and this is used also to get more delicate intonations aboard a steel vessel. The value of the apparatus was put to a good test recently when the steamer James S. Whitney was approaching the Boston lightship on her return from New York. The lighthouse was obscured by rain and fog. Thanks to the signal apparatus, the captain immediately heard the bell and got his direction. It was not until five minutes after that he heard the lightship's whistle for the first time.

The American Farmers' Balance of Trade.

DISCUSSING the balance of trade, the United States Secretary of Agriculture shows in his latest report that the favorable balance to the credit of this country is due to the farmers. The balance of trade in favor of farm products during the past fourteen years, no year excepted, aggregated \$4,806,000,000. In products, other than those of the farm, during the same period the balance of trade was adverse to this country to the extent of \$865,000,000. Our farmers not only canceled this immense obligation, but placed \$3,940,000,000 to the credit of the nation when the books of international exchange were balanced. He concludes that "it is the farmers who have paid the foreign bondholders."

American Fruit in Germany.—Last month we printed some information about the increased demand for American fruit in Europe. United States Consul-General Guenther, at Frankfort, furnishes the following additional information showing how Germany likes our fruit: "The year 1903 has witnessed a great increase in the imports of American apples into Germany. For the first eight months of 1903 the imports were 3,696 metric tons of 2,204 pounds each, against 214 tons and 543 tons during the same months in 1902 and 1901. Of American dried fruit, baked and simply preserved, the German imports for the same period were 25,251 tons, against 11,981 and 12,060 tons, respectively, in 1902 and 1901."

**THE GENUINE O. K. WASHER.**

KNOWN AND IN USE THROUGHOUT THE CIVILIZED WORLD.

The O. K. is the KING of ROTARY WASHING MACHINES! Because:

1. The O. K. is the only Rotary Washer that has Revolving Steel Ball Gearing, reducing the friction and thus making the machine so light running and almost noiseless.
2. The tub is made of Louisiana Red Cypress lumber, and corrugated similar to a washboard. The legs are made removable, and are packed inside of the tub, as are all of the castings.
3. The wheel turns right or left, pin-wheel or dasher reverses automatically, turning the clothes back and forth through the hot soap-suds, and cleaning them without rubbing them to pieces.
4. The O. K. Washer is made by experienced mechanics, and will outlast any other washer on the market.
5. The tub has a wringer box, fastened with steel brackets.
6. The lid on tub closes tight, no escape of steam.
7. Has gilded hoops, castings and name.

Prices quoted F. O. B. New York. Each O. K. Washing Machine, crated, ready for transportation abroad, weighs about ninety (90) pounds, and occupies nine (9) cubic feet.

Manufactured Exclusively by

THE WORLD'S GREATEST MECHANICAL TOY

Irving's Wizard Top
IS A Scientific Wonder.

A Top within a Top. Made of STEEL, nickel-plated. Is
a veritable **Rotary Engine**, gyrating in contrary
directions while running at full speed. Its average spin
is 8 minutes. Performs over 40 tricks. A child can spin it in 3 seconds.
It maintains its equilibrium at any angle. Walks a tight or
slack wire. **Has no equal in the novelty world.** Sells at
sight. Over 500,000 sold in 17 months in the United States. The ac-
companying cuts illustrate only a few pedestal tricks.

See Special Export Proposition.

\$18.00. Upon receipt of Eighteen Dollars in U. S. gold, or its equivalent, we will
box ready for steamer, f. o. b. cars New York, **one (1) gross of the
Tops, with Trick Outfits complete.** Size of case, 24x12x11 in.; gross weight, 54 lbs.

TARR & WONSON'S COPPER PAINT

For Wooden Vessels' Bottoms, prevents
boring of worms and all marine growth.

Awarded Eight Highest
Medals:
Gold, Silver and
Bronze.

Excels on Every
Point.
Cheapest to Use in
the End.

TESTIMONIAL. NEW YORK, Aug. 3, 1903.

Messrs. Tarr & Wonson, Ltd., Gloucester, Mass.

Gentlemen: It affords me great pleasure to comment to the credit of your copper
paint.

I used your paint on my vessel here December 10, 1902; bottom in poor condition
for good coat-damp; remained at the dock here forty-nine days; thence to New Lon-
don, Conn.; thence to Cay Frances, Cuba, where we remained at anchor in only 18 feet
water—water very warm—for eighty-seven days; thence back to New York, when I
hauled on dock for painting again, July 5, 1903. I found the surface clean and clear
of sea growth of every nature, hence my relative feelings toward your product is,
beyond doubt, to the head of the list to stand the severe test as it did of the shoal,
warm, clear Cuban water, and I claim its outfit is complete. Yours very truly,
(Signed) A. A. LOWELL, Master Sch. Edward H. Blake.

WOODWARE SUPERSEDED BY THE INTRODUCTION OF THE

International

(Galvanized Steel)

Washing Machine.

Will wash fabrics, coarse or fine, as quickly and cleanly as any washing machine made, and being made of Galvanized Steel will outlive and outwear ANY THREE Wooden Washing Machines.

The galvanizing is performed after the machine is put together, thus preventing cracks, which would cause rust.

Being absolutely germ-proof, is the only perfect, sanitary washing machine in existence.

\$11.00 Upon receipt of Eleven Dollars, U. S. Gold (or its equivalent), we will crate, ready for steamer, and deliver f.o.b. cars at New York City,

VAN BIBBER'S "ROUGH AND READY" ("El Tosco y Listo").

PRINTERS' ROLLERS

For ANY climate, hot or cold, can be made at once by any printer. You can make the best rollers, as hard or as soft as you please. No roller can be better. "Rough and Ready" does not spoil from age. English and Spanish directions. Price, 35c. List per pound, 77c. List per kilo, f. o. b. New York. Being an unfinished composition, the rollers when made cost less than this. Send to us for pamphlet. Used since 1878. We are manufacturers who sell at first hand and invite correspondence from prominent foreign dealers, to whom we offer special inducements; or, if you prefer, order through Amsinck & Co., American Trading Co. or any other responsible New York exporter.

Printers' Roller Composition.

The Type "B" Dynamo or Motor.

Price, \$26.50,
F. O. B. New York.

Output: as a Dynamo, 8 lights or 450 watts; for Electro-plating, 6 volts and 50 amperes; as a Motor it will deliver $\frac{1}{4}$ horsepower.

This is a GOOD machine and will give the best of satisfaction. Standard voltage, 110, but can be wound to order for any voltage up to 500, at special prices.

Send for Illustrated Bulletin.

OUT-HATCHES ITS COMPETITORS!

Why does the Reliable Incubator give such remarkable results—hatching 85, 90, 95 per cent. of the fertile eggs? Because our heating, regulating and ventilating systems give pure, vitalizing oxygen to germ and growing chicks. Other reasons why the Reliable is a profit-bringer are its durability, and economy of time and material. It has double top and bottom, made of best kiln-dried lumber, so treated as not to absorb moisture.

Reliable Incubators

have trays so constructed that it's easy to reach either eggs or chicks. Remember, too, that the Reliable out-hatches its competitors so often because the heat in corner or center is always the same temperature—a mellow, even heat in every cubic inch of the egg chamber. Our new catalogue is free. It tells a lively story giving warnings, and simple, yet full instructions on hatching and raising poultry successfully. Just send 10 cents to pay postage.

RELIABLE INCUBATOR & BROODER CO., Box A 000, Quincy, Ills., U. S. A.

"SUVLIGHT," THE LIGHT OF THE AGE.
Patent No. 738160—150 candlepower—saves 80 per cent. of gas and gives a beautiful electric effect.

Never Blackens Mantles.

Incandescent Burners, as generally constructed, give much annoyance and trouble always to get the exact mixture of gas and air to make the most effective combustion, but with "Suvlight," by the simple movement of the thumb, the exact proportion of gas and air and the highest possible illumination are instantly obtained. Adapted for all kinds of lamps, mantles and any variation of gas pressure. It is the long-felt want in private and business houses. Write for lowest export prices.

"SUVIO" GAS HEATERS

Introduced Into the Whole World. Good for All Seasons, "Suvio" has stood the test of time. Name "Suvio" and Patent Nos. 571916, 27876, 57325 stamped on top of each heater. If you handle similar heaters be sure they are not infringements, and thus render yourself liable for damages. "Suvio" is the real thing—better and cheaper.

SUVIO HEATING AND LIGHTING CO.,

1079 Third Ave., 40 West Broadway and 59-61 Park Place,

Cold Chisels.

We have been making Tools for over 32 years and are selling our Cold Chisels to many of the largest American jobbers.

To introduce our product to the Foreign Trade we will on receipt of \$50.00 U. S. gold, or its equivalent, pack for export and deliver in New York the following Assortment of our Cold Chisels:

15	dozen Chisels made of	3/4	inch Octagon Steel,
15	"	1/2	"
15	"	1/4	"
15	"	1/8	"
5	"	1/16	"

This assortment will weigh approximately 550 lbs. The two smallest sizes are packed 1 dozen in a box. Each box carefully labeled. This is an offer that should not be overlooked. It may not appear again, so better order now. If you send your order through an export house, better send a copy direct to us to avoid all chance of error.

TO ADVERTISERS.

THE AMERICAN EXPORTER is the only *independent* and *impartial export paper published*. It is *independent* because its publishers are not engaged in any other branch of the export business. They are neither export commission merchants nor manufacturers' selling agents, and hence they are under no more obligations to one advertiser than to another.

It is *impartial* because it treats all its patrons alike. It cannot, for this reason, and it does not, publish write-ups or puffs of any specific make of goods, no matter whether advertised in it or not. It charges the same price for the same services to all alike.

We desire it distinctly understood by those who contemplate advertising in THE AMERICAN EXPORTER that space for advertising purposes is sold only upon the merits of the publication for that purpose. For this reason no advertising solicitor or agency has any right or authority to agree to give reading notices or to perform any special service whatever to obtain orders for advertising.

We make it a practice not to discuss the merits or demerits of other export trade papers. Comments on their value may be made with more propriety by those advertisers who have had experience in the use of such publications.

FRANK MILLER'S MEDIUM Finishing Dressing.

For use of Boot and Shoe Manufacturers in finishing new stock, also for restoring old stock to its original fresh and new appearance.

Softens and Preserves.
Prevents Mould.
Does Not Scale Off.

The No 7 Hardie Painting Machine

Does the work of twenty men with brushes,
and does it better.

The **No. 7 Hardie Painting Machine** comprises a patented brass pump with brass ball valves, ingenious agitator and paint mixer, contained in a 30-gallon barrel, mounted on wrought-iron wheels, 26 inches in diameter, with 1½-inch tires, and is as easy to wheel as a baby carriage. It is equipped with 10 feet of high-grade ½-inch hose, long extension rod and special disgorging painting nozzle.

It will save its cost in a few hours' use.
Will spread any liquid of a sprayable nature.

SPECIAL OFFER FOR EXPORT ONLY:

Upon receipt of \$17.50, U. S. gold or its equivalent, we will box and deliver at New York City one **No. 7 Hardie Painting Machine complete**. Weight, 110 lbs. Packed in two cases—one, 9 cubic feet; one, 7 cubic feet.

We refer to 30,000 satisfied users of our machines.

The "Stay=There" Ready=Mixed Cold Water Paint

is composed of minerals ground in a liquid chemical, to be thinned with water. Packed in tight, iron-hooped barrels. **IT IS AS DURABLE AS OIL PAINT; will not chalk or peel off; is fireproof, waterproof, washable and sanitary.**

Upon receipt of **SIX DOLLARS** we will deliver f. o. b. cars at New York City **ONE HUNDRED GALLONS** of WHITE "STAY-THERE" PASTE PAINT. Gross weight, 400 lbs.; barrel, 28x28x20½ inches.

Our 1904 Catalogue, illustrating and describing the largest line of Painting Machines for every purpose, and the "Stay-There" Paint, will be mailed free to any part of the world. We will open accounts with responsible importers furnishing American references. Orders accepted through New York commission houses.

Rice and Coffee Hulling Machinery

Improved Rice Huller and Polisher.

OUR RICE HULLER

Is the only machine that will take rough rice and in one operation make it merchantable. For simplicity, durability and economy has no equal. They are used on plantations, and also in the largest mills. Both the Coffee and Rice Hullers are made of iron and steel, and can be knocked down and packed for mule transportation if desired.

OUR COFFEE HULLER

Will hull pulped or cherry coffee without breaking or leaving unhulled a single grain. The products will come out clean, polished and free from hulls, ready for bagging, all in one operation. It is the **Only** machine that will grind the hulls fine, so that they may be sucked by the blower through the screen underneath the machine, leaving every grain of coffee inside of the machine, no matter how small it may be.

Latest Engelberg Coffee Huller.

DIETZ Nos. 30 and 60 TUBULAR SEARCH LIGHTS.

These lamps are made for outdoor or indoor use. They give a powerful and brilliant light, and are not affected by the wind.

They are suitable for use in mills workshops, warehouses, stables and summer resorts, or in any other place where a good light is required which will not be affected by strong breezes.

Where it is desired to light up a long row of animals or a long, narrow room of any kind, these lamps are especially desirable.

No. 30 is fitted with our patent bull's-eye lens on perforated plate, adding to the appearance of the light.

No. 30 has a blizzard globe, 1-inch wick and a bright tin reflector 12 inches in diameter. Price, \$30.00 dozen.

No. 60 has a No. 2 globe, 1 1/2-inch wick and a bright tin reflector 16 inches in diameter. Price, \$72.00 dozen.

We are pleased to send complete catalogues (Spanish or English) and price list to those interested.

"The White Lily Washers, Wash Lily White."

Such is the verdict of thousands of users throughout the "States" of the

WHITE LILY WASHER.
WASHES LILY WHITE.

White Lily Washer.

The White Lily (Rotary) Washer is made from Louisiana and Mississippi Red Cypress, which is less susceptible to expansion and contraction caused by hot or cold water than any other timber known. Our hinges are put on with bolts instead of screws, and every part is reinforced wherever necessary, thus making the

Most Durable Washing Machine Made.

By the use of a HIGH-SPEED ROTARY WASHING MACHINE you can create a soap-suds or foam without having to turn the fly-wheel so fast that the SPEED, rather than the work, tires the operator.

The speed of the White Lily Washer is 2 1/2 turns of the fly-wheel to one turn and return of the dasher. The White Lily Washer is the Highest-Speed Rotary Washing Machine made. Will create more soap-suds with less exertion, and will wash clothes cleaner than any other known washing machine.

Special Offer to Introduce Abroad:

Upon receipt of **Thirty dollars** (\$30.00) in U. S. gold or its equivalent we will box, ready for transportation abroad and delivered F. O. B. cars at New York City, **Six (6) White Lily Washing Machines.**

Griffin Cleaner and Paste Combination

for Cleaning and Polishing Russet and Russia Leather Shoes and all Articles made of Russet and Russia Leather.

NOTE—Our Cleaner contains no Camphor.

Our Cleaner and Paste Combination for cleaning and polishing Russet and Russia Leather Shoes (and all articles made of Russet and Russia Leather) cannot be surpassed, if used according to directions.

The Cleaner cleans and removes stains, and the paste produces a brilliant, durable waterproof polish, which is not sticky or gummy. We also make it in different colors, ox blood and brown.

Our Parisian Dressing.

A Black Dressing for Ladies' Shoes. Is considered by good judges to be the best and nicest put-up 10-cent dressing on the market.

We guarantee it not to contain anything injurious to the leather. It contains oil which helps to keep the leather soft and pliable. Packed in one and three dozen boxes. Price, per gross, \$8.00. Discount, 10 per cent.

Griffin Sterling Combination

Our Sterling Combination for dressing and producing a gloss on shoes made of Box-Calf, Cordovan, Vici Kid, French Enamel and all fine dry black leathers. Cannot be surpassed if used according to directions. It is easily applied, polishes quickly and easily; its lustre is brilliant, durable and not sticky or gummy and will not crack or scale off. It keeps the finest of leather soft. We guarantee it not to injure the leather in the slightest degree, as it contains no acid or other injurious substances.

A circular in each package giving full directions.

Price per gross, large size.....\$14.00

Price per gross, small size..... 7.50

Discount, 10 per cent.

Griffin Russet Leather Polishing Paste.

Our Russet Leather Paste for producing a high gloss on Russet and Brown Leather Shoes (and all articles made of Russet or Brown Leather) cannot be surpassed, if used according to directions. It polishes quickly and easily; its lustre is brilliant, durable and waterproof, and yet is not a varnish.

Excellent for vici kid.

We guarantee it not to injure the leather in the slightest degree, as it is free from acids, and will not soil the finest of fabrics.

If the shoe is dirty it should first be cleaned with Griffin Russet Leather Cleaner.

Price per gross, large size.....\$6.00

Price per gross, small size..... 3.50

Discount, 10 per cent.

WORTH WAITING FOR

Griffin Patent Leather Polishing Paste.

Our Patent Leather Paste for restoring the gloss to all articles made of Patent and Enamel Kid Leather cannot be surpassed. It polishes quickly and easily; its lustre is brilliant, durable and waterproof, and is not a varnish, as it leaves no coating.

We guarantee it not to injure the leather, as it is free from acids.

It is invaluable for brightening the saddle and blinders of harness, as the polish is waterproof.

Just the thing for manufacturers of harness to use, as it will prevent the Patent Leather parts from becoming dull.

Price per gross, large size.....\$6.00

Price per gross, small size..... 3.50

The WATROUS SANITARY SPECIALTIES

The Watrous Combination Bath Fixture.

This fixture supplies hot or cold water or any desired mixture, by simply turning the handle to the right or left. To empty bathtub, simply lift the handle.

It is the only perfectly sanitary bath fixture made, as the tube is always filled with clean water direct from the supply instead of from the tub, and therefore impossible to become foul.

Has an independent supply passage direct to tub. **Can be attached to any bathtub.** Is constructed with ordinary Fuller balls. Is simple, cheap, durable and heavily nickel plated.

Upon receipt of price we will box, ready for steamer, and deliver F. O. B. cars New York, as follows:
One (1) Watrous Aquameter Water Closet, complete (Fig. "A 4.") as shown. Six (6) cubic feet. Weight, 100 pounds. \$30.00
One (1) Combination Hot and Cold Water Bath Fixture, as shown. ¾ cubic feet. Weight, 17 pounds. \$15.00

Our sanitary specialties are protected by U. S. and foreign patents. Our illustrated booklet mailed, postpaid, to any part of the world. Please mail us duplicate order when ordering through commission houses.

The Watrous Aquameter Water Closets.

Adopted by **The Pullman Company** and **all important Railway and Steamship Companies** in the United States.

These closets have no equal for **Public Buildings, Residences, Steamships, Private and Parlor Cars.**

The closet shown operates perfectly with ½-inch or ¾-inch pipe, according to pressure.

Connected direct to service pipe, without any tank. Uses from one to three gallons of water to each flush. Saves 50 per cent. in water bills. Noiseless and positive in action. Neat and durable. Successful everywhere. Fully guaranteed. Thousands in use everywhere.

Entered at the New York Post Office as Second-class Matter.

OUR ADVERTISERS.

AN Australian importer, in sending in his subscription last month to THE AMERICAN EXPORTER, had this to say about it: "You print a very interesting paper, and I want to read it regularly. I have been getting copies of it irregularly, but I cannot do without it regularly. My business is increasing and I must have it promptly. Your reading matter first attracted my notice, but in looking over the advertising columns I found the announcements of so many reliable firms dealing in goods we want in Australia that I think your advertising pages are better than a monthly trade directory. Firms that advertise in a journal of your high standing must be reliable, and you have so many of them that it is not necessary to go further. I have had occasion to give orders to some of your advertisers, and the orders have been filled promptly and satisfactorily. I am building up a good business out of an unpromising one through having received a stray copy of your publication about two years ago. Until now I have not appreciated the necessity of getting it promptly every month. I have found it as essential to my business as is my store. I hope you will have every success."

Letters of this nature are pleasant to receive. The writer is quite right in assuming that only reliable firms are admitted to the advertising columns of this journal, and he is quite right also in assuming that its columns contain the announcements of the bulk of American manufacturers of reputation and standing who are engaged in the export trade. There are, of course, exceptions to every rule, for there are some few exporters who do not realize the value of addressing their announcements to prospective customers, preferring, as they may, to let the customers seek them, something that, of course, rarely occurs. In this connection, an extract from a letter from a customer which one of our advertisers was good enough to forward to us contained this philosophical declaration:

"I only know you through your advertisement in THE AMERICAN EXPORTER, but any firm that is big enough to advertise in THE EXPORTER is good enough for me to do business with and will take care of my orders all right."

THE AMERICAN EXPORTER has always been as careful of the quality of its advertisements as it has been of its reading matter, and the result has been entirely satisfactory both to its readers and to its publishers. Its advertisers have invariably been successful and the customers have been pleased. In the export trade, as in other lines of business, this trite saying applies forcibly: "Winners are advertisers; advertisers are winners."

THE efforts of Secretary of State Hay, on behalf of the American Government, to preserve the integrity of China and prevent other nations from taking part in and thereby spreading the extent of the Japanese-Russian war, seem to have met with general favor throughout the world.

BIG FIRE BRINGS OUT GRIT.

AMERICAN cooperation, enterprise and genuine pluck were displayed in a characteristic manner last month, on the occasion of a big fire in the city of Baltimore, State of Maryland. This fire did over \$100,000,000 of damage, and wiped out most of the business section of a prosperous and well-built municipality. In point of fighting the fire, which was not checked for more than half a day after it started, the local fire department was inadequate. The whole city would have been wiped out but for the prompt assistance given by other municipalities. Scores of nearby cities sent fire apparatus to burning Baltimore, the chief and most effective detachments going from the cities of Philadelphia, 90 miles away, and from New York, 180 miles from the fire. Two trainloads of fire engines and apparatus, enough to completely protect some smaller cities, went from New York alone, and it was this effective help that saved the remainder of the burning city. The promptness with which New York firemen went to the fire 180 miles away was a tribute to their excellent discipline and their quick transportation showed splendid service by the railroads. The Baltimore firemen do not appear to have been derelict, nor was the city badly built. The calamity was simply one that human foresight could not have averted. The lesson of it is the wonderful display of helpfulness of countrymen in distress or danger that is natural to Americans.

The fire itself will go on record as one of the most disastrous, in property loss, that we have ever had, but it brought out many strong points of our countrymen. The flames were still seething through the city, the telegraph offices had been destroyed, and the newspaper plants had been burned. The daily newspaper men were the first to act. They made arrangements with plants in the city of Washington, forty miles away, to get out their regular issues; and, considering the disadvantages and distance, accomplished remarkable results. Not a newspaper missed its regular issue, and the Baltimore papers, gotten out forty miles away, in new, temporary homes, within six hours after the destruction of their own offices, told the story of the fire that was still leveling blocks of costly structures. The morning newspapers came out almost on time, and gave their readers complete accounts of the conflagration as far as it had gone. It was then that the business men of Baltimore realized the extent of their apparent misfortune. Instead of counting their losses, they began at once to find out how they could repair the damage. The telegraph wires were restored even before the fire was checked, and merchants and manufacturers kept them busy with messages about new goods and new machinery. Contractors and builders were in immediate demand, and owners of property out of the fire's path were as busy negotiating with the homeless merchants as were the firemen in trying to check the spread of the conflagration. The Mayor of the city issued a proclamation in which he said a new Baltimore would arise from the ruins, "more beautiful and greater than the old city." That was the spirit of his people, and they gave evidence of its genuineness by their actions. The blow was one that would destroy any city that was not inhabited by men of enterprise, grit and courage. Baltimore was a beautiful city. There was little left to be desired. But the new city will be so much better that it will come to be called in future years a shining monument of the chief characteristics of the American people of the current era. The fire has but served to spur Baltimore's citizens to take a more active part in our progressiveness.

JAPANESE are certainly progressive commercially. In that empire foreign commercial agents are exempt from all tax as commercial agents, their samples are admitted free of duty, and every means is taken to give them full opportunity for introducing and marketing their wares. Precautions are taken, of course, to prevent imposition, but these regulations are not irksome in any way.

OUR exporters are much interested in the agitation for a further extension of the international parcels post. Lower rates and larger packages would certainly facilitate the transmission of samples and tend to increase trade.

"CORNERS" IN COMMODITIES.

THE advance of the cotton market in America last month to a point where the price of that commodity was placed as high as 18 cents per pound would have caused a panic six months ago. Nevertheless, it was a remarkable event in the history of the market, and will have a world-wide effect on the future of cotton. The speculators have made enormous fictitious fortunes in advancing prices, and outsiders who have tried to get into the combination have come out of it singed. There are speculators everywhere, but they have rarely been able in recent years to control such a commodity as cotton for so protracted a period. Their course has been one of detrimental effect upon this country, as well as other countries, largely because we grow cotton crops only once a year. The ultimate result will be to make cotton cheaper than it ever has been, except as to its reasonable, rational value as a commodity, for the extraordinary prices will cause American cotton growers to plant probably double the usual acreage for the new crop, new men will be induced to cultivate the plant which produces the now costly article of commerce, and the attention of men of keen anticipation of future riches in other zones that correspond to our cotton belt has already been attracted by the fabulous fortunes and exorbitant profits that now seem to attach to cotton.

Nothing that we might say would change the purpose of any of these new cultivators, but it is nevertheless a fact that the cotton cornerers have overreached themselves to an extent that will cause a reaction beneficial to all the interests involved, except those of the speculators. That has been the history of all corners in commodities or staples in America. It is not long since a man died in this country in an almost penniless condition. He cornered grain and made so many vast fortunes while at his zenith that he was accounted the richest man in the United States. The reaction that we predict in cotton occurred in grain. The speculator lost all he had made in trying to stem the tide of lower prices due to the increased production which he himself had provoked. This man lasted longer than the cotton magnate of the present can possibly last. It was in September, 1888, that P. B. Hutchinson, colloquially called "Old Hutch," made \$3,000,000 in one day in his famous wheat corner. He lifted the price of wheat to \$2 a bushel. It had been under the dollar. The same wheat now ranges around 75 cents a bushel, but that is only one of the effects of the greater activity which was caused by \$2 wheat. On the Chicago Board of Trade in August, 1893, "Old Hutch" was compelled to offer his membership for sale, and it realized a very small price. In five years he had come to the limit of fighting the fertility of the soil and was overcome by the enormous impetus he had given to grain growing. In fact, he had lost everything in his futile efforts to stem the tide of agricultural activity and bucolic prosperity which he had started. Times have changed since "Old Hutch" met his Waterloo. Improved agricultural machinery, quicker appreciation of possibilities and other elements that are working in the upbuilding of the American nation will cut down "Old Hutch's" three or four years of continued profitable activity, more than a decade ago, to possibly one year, not more than two, in the cotton-growing industry.

A year ago we called attention to efforts that were then being made, with some apparent prospect of success, to corner the coffee market. The first attempt to corner this market occurred at about the time "Old Hutch" was preparing for his *coup* in grain. The attempt caused a panic. Other efforts were made in subsequent years, but without really important results. The latest attempt, engineered by some of the cotton cornerers, has proved a miserable fiasco. Dating back from 1887 there have been periodical efforts to corner coffee, but the high prices forced in the panic of that year so stimulated production that subsequent attempts to put the commodity up to abnormal prices have been unsuccessful.

Corners in commodities have had their day. The cotton corner will be the last one, in all probability. The world is growing, and nature is becoming more productive every year. Men with money enough to control any commodity that comes from the cultivation of the soil are wise enough to study the history of such attempts, and as time goes on there will be fewer of them who will risk their riches

in what is practically a fight against nature, aided by ambitious men and the improved agricultural machinery that American manufacturers place within easy reach of everybody throughout the world.

The cotton corner has done incalculable harm to hundreds of thousands of people, but its after effects will be beneficial to myriads of people on both continents. The increased cultivation of the plant will give increased employment to many more people, manufacturers of machinery used in the industry will find increased call for their products, and the general consumption of cotton-made goods will be so much greater that the mills will have more to do. Meanwhile it may be said for the benefit of our foreign readers who may be attracted by the prospects of profitable cotton cultivation that American manufacturers produce as good machinery for use in the industry as can be obtained anywhere.

THE MACHINERY INDUSTRY.

THE trade in machinery, both for export and domestic purposes, has shown a gratifying improvement recently. Some features of it which apply to both branches of trade are interesting, for they are evidence of the fact that our manufacturers are giving the best possible products for the prices which they charge. Sales of small engines, including steam, gas and hot-air engines, have increased, while the demand for other motors and power equipment machinery both at home and abroad have shown a decided and satisfactory gain. There is no reason why this condition should not prevail, for American manufacturers are always striving to excel perfection, if that can possibly be done.

The sale of agricultural implements for export has also increased in the last two months, and the demand for mining machinery and power equipment, as well as for machine tools, has shown a marked advance over corresponding previous periods. Without going into statistics and details, which would not interest our readers, it may be said that the situation in respect to the articles mentioned is so favorable that it deserves the attention which we call to it at this time.

The American manufacturers of the present day are shrewd business men, who give their customers the very best that they or anybody else can give. They desire to keep their patrons and know how to do it. The result is not unexpected, but the apparent growth of trade is less than the real growth, for durable implements last longer than the others and do not require replacing so frequently.

THE BIG DAKOTA AFLOAT.

THE mammoth trans-Pacific steamship, Dakota, built upon the Atlantic Coast, was successfully launched last month at New London, U. S. A. It was an event no less notable than that which was described in THE AMERICAN EXPORTER last May, when the Dakota's twin sister, elder by a few months in launching, but still a twin in details of construction, was sent into the American River Thames. Each of these ships is a remarkable tribute to modern American shipbuilding, an industry which has lagged until recently. Each is the biggest cargo carrier in the world, each is the largest ship ever built in America, and both are being put together in a substantial shape and style that will do credit to their enterprising builders and to the country whose flag they will fly.

James J. Hill is the head of the company that owns the ships. He has such faith in the Pacific Ocean commerce of the United States that his company has invested \$5,000,000 in these two great vessels. No subsidy has attracted Mr. Hill and his associates. Their only incentive is faith in the future of the commerce of their country. Such faith cannot fail to meet a full realization.

SOME notion of the progress made by experts in the metal industry is conveyed to the average reader when he is informed that at the recent quarterly meeting of the British Iron and Steel Trade a paper was read on "The Diseases of Steel," which was followed by a learned technical and practical exposition of the ailments of the metal, although one member did express a preference for the word "mysteries" in place of diseases.

REASONS FOR AMERICAN SUCCESS.

ONE of the contributing reasons to the success of American merchants may interest some of our foreign readers. It is difficult to approach the subject without encountering the suspicion that some moral lecture is involved, but the change in habits of New York and other American business men within the last decade is so noticeable that in its effects, as described by shrewd observers, it marks an important step in the progress of the country. The *New York World* recently printed a page of very interesting matter on the subject, but it gave its information in a shape that appealed more to the men who have not been successful—such few as we have in America—than to others. The successful New Yorkers, as a general proposition, are not entirely abstemious in the matter of using spirituous liquors, but they are not what may be called tipplers. The *World*, in its article, mentions numerous successful Americans who have never been heard of outside of this country, and shows that their habits of life are regular. They arise early, go about their business and enjoy recreation, retiring at a reasonably early hour. Most of them are abstainers from wine and other liquors until the day's work is over, and they never drink intoxicants between meals during the day.

This is a notable change from the customs of ten and twenty years ago, or even longer. Drinking and the so-called good-fellowship that went with it were once supposed to be essentials of all business transactions, just as they are now to a very limited degree. Some wise man, whose name is unknown to fame, discovered about fifteen years ago that he could sell his goods to better advantage by omitting the item of "entertainment" that was invariably charged to the purchase in his bill without the latter's knowledge. He is reported at the start to have found difficulty in convincing buyers that his wares were equal to the others', but he won out and his victory marked the beginning of the decline of the "drummer" or commercial traveler. Business men began to buy goods for their intrinsic worth, not for the sake of the entertainment in the way of theaters or dinners that the seller might give them. There was a hard fight against the innovation, and it was not successful until some hard-headed merchants found competitors selling the same goods at lower prices and sought to ascertain the reason. When they discovered that they could buy their goods on equal terms with their competitors, if the "entertainment" of their representatives was cut out there was the beginning of a revolution in the wholesale trade in the metropolis of America.

The revolution has been going on ever since, and rivals are selling their goods upon their merits, with very few exceptions. All of which, our foreign readers will naturally say, is of little interest to them. But the effect of it all has been of immeasurable importance to them. Twenty years ago and for many years afterward manufacturers engaged in the export trade thought they could only sell goods by sending salesmen to exploit the merits of their products, much after the fashion of American merchants, who formerly had to do the same thing to make known the good qualities of their wares. The establishment of THE AMERICAN EXPORTER gave them a new means of communicating with probable purchasers everywhere on the face of the globe. Exporters who saw the advantage of presenting their claims to a great many persons at an expense no greater than would be involved in sending a personal representative to a solitary individual, who perhaps would not buy, if he could, early saw the advantages of the new medium of doing business. There were enough of these progressive and far-sighted men to make THE AMERICAN EXPORTER the most important journal in its field. This we do not say in the way of endeavoring to appropriate laurels, but because the two comparatively new methods of doing business seem to have attracted merchants and manufacturers in both the domestic and export trade at almost the same time.

One important result of the change in methods is that the purchaser gets the real value of his purchase. In the export trade he does not have to pay the costly bills of commercial travelers, in addition to the price charged by the manufacturers. In fact, any

purchaser on the face of the globe who buys from an advertiser in this journal need figure on no additional expense which would not be paid by a townsman of the manufacturer, except the cost of transportation. The effect of the evolution has brought the seller and purchaser, both in and out of America, so much closer together, both in trade and price, that only our foreign readers who have been in the trade for the last quarter of a century can realize the difference so far as it affects them. The net result is that American goods are better and cheaper as to intrinsic merit and price than they ever were before.

WAR AND AMERICAN DIPLOMACY.

HOSTILITIES between Japan and Russia have assumed a state of war, which condition is much to be regretted, for it has seemed all along that the troubles existing between the two nations might easily be settled by some more peaceful method than the destruction of warships and the loss of human life, with the interruption of the commerce of the two nations that is inevitable under such circumstances. At the time we write hostilities have not progressed far enough to enable us to comment upon the relative chances of the opposing nations. We are friendly to both, and are sorry to see them at war. Both nations have in their navies warships built in America. They are vessels of the highest type of naval marine architecture, and in their work at war Americans will naturally have a sentimental interest. As we write efforts are being made to secure a suspension of hostilities, but it is doubtful if they will be successful.

At this time it is interesting to recount a tribute which one of the contending diplomats recently paid to the American executive Government. Viscount Hayashi, the Japanese Minister at the Court of St. James, who bore the brunt of the diplomatic struggle in Europe between Japan and Russia, is a great admirer of American diplomacy. Discussing it, he said recently that American diplomacy was far superior to medieval methods, which still prevail with European statesmen. It is frank and always to the point the moment a controversy arises. He continued:

"American statemen make it clear what the American Government wants. Americans say frankly what they want and what they intend to have. What is the result? They generally get it. If they don't, those opposed to them know the consequences. There is no beating about the bush. There is none of the delay and suspense and consequent loss of business which invariably attends any diplomatic attempt to settle disputes with European nations.

"Take as an instance the case of the two treaty ports which China has undertaken to open. The very day after the treaty was ratified the names of the consuls appointed to the ports were announced in Washington. Yes, the old world can learn from the new to be frank and open in matters of diplomacy. Nothing do I admire more about the methods of America and its government than its diplomacy. I always know where I am when treating with an American ambassador or diplomatic representative."

The comment as to American methods made by the Viscount applies with equal force to American commercialism. American exporters sell what they have to offer for its real value, and do not beat about the bush.

IN another column we give an account of a novel educational experiment which will be tried this summer by four prominent American universities. It involves leasing an entire mine for the summer school of instruction, and the cost, \$12,000, has been provided for by an eminent American, who is sanguine of its practicability. No better way could be devised of giving the students practical education in mining, and under the auspices of the foremost universities of America there can be nothing but success. Our educational methods are certainly growing more and more intensely practical.

SIR HENRY MORTIMER DURAND, the new British Ambassador at Washington, made his first American appearance last month as an after-dinner speaker. He made a distinctly favorable impression in his expressions of solid friendship, with nothing of fulsome flattery in his utterances.

DEPARTMENTS OF COMMERCE.

THE new American Department of Commerce is making rapid progress in organizing its agencies to further the interests of our merchants engaged in the export trade. Secretary Cortelyou is singularly well-fitted to manage the department, for he is a man of wide experience, broad knowledge and of wonderful executive ability. His first annual report was briefly referred to in the last issue of *THE AMERICAN EXPORTER*. The details of the report would probably interest many of our readers, but the machinery of the Department of Commerce is so extensive that many columns would be required to give an adequate idea of the diversity and scope of the important work which is being done with marvelous system and attention to detail. The future of this department of our Government is destined to be of incalculable value to both American and international trade and commerce. These observations are called forth by an editorial which recently appeared in the *London Commercial Intelligence* concerning the agitation going on in Great Britain toward establishing a similar branch of the Government in that country. The value of such a department is appreciated in the British Empire and as long ago as last April we printed the action of the London Chamber of Commerce in respect to the movement in favor of creating a Minister of Commerce to correspond with our Secretary of Commerce. The movement in Great Britain has made slow progress, too slow to please unenvied neighbors and much too slow to please persons generally who are interested in the extension of international trade. The *Commercial Intelligence*, in the course of its comments, says things that are of universal interest:

"It is surely an anomaly that a great trading nation like the United Kingdom should divide the administration of trade and commerce between the Board of Trade, the Foreign Office and the Home Office. 'This cumbrous system,' writes a leading parliamentary authority, 'ought to be done away with and the great interests of commerce intrusted to the care and responsibility of one department, with a staff solely for that purpose and acting, where necessary, with the Foreign Office.' At the head of this department should be a minister endowed with the highest Cabinet rank, who should have the assistance of a permanent board of advisory officials, each an expert in the various subdepartments, which should constitute the ministry. Most of the present departments of the Board of Trade should hold their place in this reorganized office. The commercial department and the Foreign Office should merge in it, and the consular service should be administered by the Minister of Commerce. There can be little doubt that such an arrangement as this would serve the best interests of the country and insure our trade and commerce that attention from the Government which it is now denied.

"It is sufficient to glance at some of the anomalies and disabilities which press most hardly on our business men to see how strong a case there is for immediate reform. Much of the merchant shipping legislation is obsolete. In spite of recent amendments, our patent laws are in a most unsatisfactory condition and afford a striking contrast to similar legislation in the United States. Our consuls, despite the fact that some of them at least are earnest and thorough, do not command the confidence of business men. Moreover, our consuls do not have a fair chance to do themselves justice. Their reports, often belated enough before they reach this country, have then to filter through the Foreign Office and the Board of Trade before they reach the British merchant, whose interest in the matters with which they deal has often entirely vanished long before these documents reach him.

"We ought to have a thoroughly efficient system under which British consuls and commercial attachés throughout the world could send their 'news'—while it is news—straight to the British trader at home, something after the fashion that is adopted in the United States. No one who has studied the question can doubt that our railway and canal systems, charges, etc., are in need of thorough reform. The Board of Trade as at present constituted has altogether insufficient powers to safeguard the interests of traders. It is little short of a scandal and a disgrace that a com-

mercial nation should be content to have at the head of its Board of Trade a gentleman who, however estimable in his private capacity, has absolutely no business training or other qualifications fitting him to occupy that very important position. We need a minister of commerce, and if the Prime Minister should create this office and appoint to it a thoroughly efficient statesman he would do much to restore confidence among business men in an administration that has so far been marked chiefly by its capacity for muddling and mismanagement."

It is a noteworthy fact that the American Government has already in operation precisely the system advised by our contemporary. As we said last April, we will watch the outcome of the movement in the United Kingdom with great interest, as will also nearly every reader of this journal.

NORTH AMERICAN CONTINENT.

ELOQUENT and pregnant words are contained in an able article written by Mr. John Charlton, M.P., of Canada, which was printed in the last issue of the *North American Review*. He says:

"In the future the relations of Canada with the United States will have much influence upon the relations of the United States and Great Britain. Under some circumstances, this influence may be a paramount one. With the question of better trade and political relations with the United States are bound up influences that will in a marked degree influence the future of the English-speaking race upon the North American Continent. It is not the present or the immediate future alone that demands consideration. The day will come when 400,000,000 people who speak the English tongue will occupy the 7,000,000 square miles which the Anglo-Saxon now possesses in America. Shall this great future be one of harmony, where justice, truth, good-will and mutually advantageous relations shall prevail? Heaven grant that it may; and let all thoughtful, well-meaning men in the two countries realize that the words and actions of Canadian and American jingoes are not in the interests of the future myriads for whom we are now laying down the lines."

We have referred several times recently to the future of Canada and have discussed its hopes and prospects from various points of view. The dividing line drawn between the two countries does seem to be an arbitrary one from many points of view, commercially and politically, but neither the peoples of the two countries nor the conditions are yet ripe for a unification such as our Canadian friend suggests. As for peace, Mr. Charlton may be sure that the two countries will have it at any cost, so to say.

WAR'S effects on Russians are not limited to torpedoes and other projectiles. The tea trade is cut off and Siberians, who have been large buyers of Japanese tea, will have to use some other beverage for a time. At Vladivostock, our commercial agent, Mr. Greener, reports the annual trade to have been about 500,000 boxes of green and black tea, ranging from \$12.87 to \$14.93 per box.

SOME of our contemporaries have just discovered that work on the Panama Canal has been kept up uninterruptedly under the auspices of the United States Government, regardless of treaty troubles. The fact was printed in *THE AMERICAN EXPORTER* as long ago as last May.

CUBA has been left now entirely to the Cubans. On February 4th the last vestige of American occupation disappeared, when the last battalion of United States soldiers sailed for home. Thus has our Government kept full faith with the inhabitants of the island republic.

THE *Furniture Trade Review* calls attention to the fact that British Africa has recently doubled her purchases of American furniture. The residents of that section of the globe have shown other evidence of appreciating good American goods at reasonable prices.

THE annual dinners of the Pilgrims' Clubs simultaneously in New York and London are becoming more interesting every year, typifying, as they do, the closer and more friendly relations between the two great English-speaking nations.

GAS TURBINES NEXT.

Experiments with Steam Inspire Inventors to Further Invade the Field.

MUCH has been printed about the marvels to be accomplished by the steam turbine. The next step in turbine advancement seems destined to be in connection with gas engines. A gentleman who recently received an advanced degree at a Western university in virtue of a very thorough investigation on the subject of the gas turbine is now in the employ of a large electric company, and the inference is that he will have at his disposal the extensive facilities of this company for conducting experiments that may eventually lead to a successful gas turbine. This gentleman is Sanford A. Moss, who has made a special study of the subject of gas turbines since 1898. He received the degree of master of science at the University of California, U. S. A., and has also studied at Cornell University, specializing upon the same subject—that of the gas turbine.

The great thermodynamic advantage claimed for the steam turbine over the steam reciprocating engine is that there is no condensation and reevaporation through contact with metal surfaces which are alternately heated and cooled. The only condensation in a steam turbine to amount to anything comes from the conversion of the energy of the steam into work. In the gas turbine there is, of course, no condensation to enter into the question, but there is an opportunity for another and more important gain through the abolition of the water jacket. A writer in *Machinery* declares that it is a singular fact that the turbine is theoretically and probably practically capable of effecting a saving over the reciprocating engine, whether used with steam or with heated air, but because of entirely different reasons in each case.

It is well known that the efficiency of the gas engine depends mainly upon the degree of compression pressure attained in the working fluid. When operating upon the Otto cycle the gas and air are compressed to as great a pressure as practicable, and then are exploded, giving a still higher pressure. This same process can be employed in connection with a gas turbine and has been advocated for that purpose. Under this plan the air and gas would be compressed and exploded in a chamber lined with refractory material, and would then discharge through a diverting nozzle and impinge against the blades of a turbine wheel, as in the case of the De Laval steam turbine. The diverging nozzle would act as an expansion nozzle, to reduce the pressure of the gases to atmospheric pressure and convert their potential energy into kinetic energy before doing work upon the wheel. The discharge would occur in puffs, an impulse being given as often as an explosion occurred.

Another method of accomplishing the result would be to have the combustion element burn continuously in contact with compressed air in a refractory chamber from which the heated air would discharge continuously through the expansion nozzle. The pressure in the chamber would remain constant under such conditions and the question of efficiency of the apparatus would depend solely upon the pressure that was attained through compression, as the relative amount of work done in an engine working upon this cycle does not depend upon the temperature of combustion. The efficiency of this cycle is not as high as that of the Otto cycle, but for turbine purposes would have the merit of giving continuous discharge through the nozzle instead of intermittent discharge. This plan of compression and then heating under constant pressure was employed in a petroleum engine, which was one of the pioneers in the gas engine field.

The perfection of the gas turbine will not be an easy proposition. It will either have to be accomplished by individuals, working in a haphazard way through a long period of years, or by the concentrated efforts of some large firm, says *Machinery*. The latter plan will undoubtedly result in the quicker solution of the problem. One of the problems will be that of the temperature of the gas and its effect upon the metal of the turbine wheel. While the hot air will not come in contact with any of the bearings of the wheel it is evident that the blades might not stand up to their work if subjected to a very high temperature. The fact that all bearings and wearing surfaces, however, would be removed from contact with the hot gases would undoubtedly make the water jacket unnecessary.

Locomotives While You Wait, in America.

A WRITER in the *Booklovers' Magazine* tells the following interesting story of American promptness: "There is a very good story told of a British master mechanic, who was sent over to buy some American locomotives because the home shop could not get them out in time. He was courteously received at Baldwin's, where locomotives had been built for nearly every railway in the world except those in England. The Briton was in haste. Time was to be an element of any contract; the quicker the better and a big premium for haste. The partners reflected that there were some locomotives under way, which the visitor had already seen and wished duplicated, and that the Americans who had ordered them would be willing to waive claims, seeing that others could be completed for them on time. The Briton became impatient for a definite statement as to the time when delivery aboard ship would commence. Finally one of the partners remarked: 'We are very anxious to oblige you in every possible way, and will hasten the work, but we cannot perform miracles. The best we can do is to begin deliveries one week from tomorrow.' The Briton fell in a dead faint.

"The following equally good story the firm vouches for: 'When General Kitchener was fighting his way southward, inch by inch, into the Soudan, his

chief problem was that of transportation. To solve this he constructed the famous strategic railway. All the material was promptly available in Great Britain except the locomotives and bridges. To construct these English builders wanted so much time that it would have disturbed his whole plan of campaign. Philadelphians built the Atbara bridge as if by magic, and to Philadelphia he sent for locomotives. The Baldwins undertook to do the work in twelve weeks, a considerably less number than the months required by British bidders, and were offered a handsome bonus for any gain in time. The War Department cabled from London one fine morning that an inspector had sailed that day to watch the construction. The reply was sent that they were already completed, thirty-seven days ahead of time. Ten days later the astonished inspector walked in to find his trip had caused an unnecessary delay in delivery. The firm used the bonus for anticipated delivery in sending one of its bright young men with the locomotives to superintend their erection, and to watch carefully their initial operation."

This Is the Biggest Pump in the World.

IN the United States there is a pump in daily use which, without being crowded to the limit of its capacity, can deliver 2,500,000 gallons of water every hour in the twenty-four. Moreover, it does the work without making as much noise as is made by the operation of the old-style sewing-machine. Outside the doors of the great building which houses it no sound is heard from within, and, standing beside the monster upon the brink of the pit connected with the lake from which the water is taken, almost the only sound is the noise of the suction, as with every stroke more than a thousand gallons are lifted.

It is a triple-expansion pumping-engine, with a capacity of 60,000,000 gallons, standing nearly 50 feet in height, and requiring 1,500 horse-power for its operation. It has been proved by actual test that the nominal capacity can be easily maintained for an indefinite time without injury or strain, and that pushed to its full capacity the pump could handle approximately 75,000,000 gallons in twenty-four consecutive hours. The duty of the pump is to furnish water for the great stamp mills of the Calumet & Hecla Company, which has twenty-two steam pumps in continuous operation, daily pulverizing 5,000 tons of conglomerate rock into sand so fine that it can be carried away by a stream of swiftly running water.

The pump is housed in a special building near the shore of the lake, and it forces a steady stream of water to the upper portions of the mill, where innumerable small jets of water play upon the great slime tables and jigs. Here the specific gravity of the fine particles of copper contained in the rock separates the mineral from the worthless sand, and the size and force of the streams of water are so nicely regulated as to wash away the sand and yet carry with it the minimum of copper.

Coal Mined by Machines in America.

CHARACTERISTIC of the age in which we live is the growing use of mine machines in the bituminous coal mines of the United States. The report of Edward W. Parker on the production of coal in 1902, which forms part of the annual volume of mineral resources just published by the United States Geological Survey, shows that 5,418 machines were employed in 1902, as against 2,622 in 1898. In a few of the States there was a decided decrease in the number of machines used, but with the exception of Wyoming these were States in which comparatively little development in the mechanical production of coal has been made. All of the States where the use of machines had exerted any significant effect upon the production prior to 1902 showed substantial increase in that year.

The total machine-mined product reported for 1902 was 69,611,582 short tons, an increase, as compared with 57,843,335 short tons in 1901, of 11,768,247 short tons, or 20 per cent. As the total production of bituminous coal in the United States in 1902 was 15 per cent. larger than in 1901, it will be seen that, on the whole, the production by the use of machines more than kept pace with the increased output. In fact, the percentage of the machine-mined product to the total output has increased from 25.68 in 1901 to 26.09 in 1902.

Improvement in Cigar Manufacture.

AMERICAN cigar manufacturers are adopting the latest and most improved methods of conducting their business. Cigars, as everybody knows, are affected by temperature and climatic conditions after they are ready for sale, but in their manufacture the condition of the atmosphere within the building is also of vital importance. The air must be kept moist and at a constant warm temperature, both in the winter and summer season. It has been found that for maintaining an even, moist and warm temperature the fan system is peculiarly adaptable, because the quantity and quality of the air is under absolute control, and may be varied at will. Fresh air is drawn from outside the building by means of a fan, is circulated through a moistening chamber, and, in the winter season, between coils of steam pipes inclosed in a fireproof steel-plate jacket, and delivered under pressure to the work-rooms, through distributing ducts. The expense of operating is very low, as no heat is wasted. The idea has been adopted recently by some of the most prominent American cigar manufacturers, and its success has been assured by their experience.

TREATY WITH ABYSSINIA.

Complete Commercial Success of the American Invasion of Emperor Menelik's Domain.

WE learn by news advices from Jubutit, Somaliland, that the United States expedition to Abyssinia, under Consul-General Skinner, of Mar-seilles, which arrived at Adis Abeba, December 21st, has since successfully carried out the principal features of the mission, which has been described in previous issues of THE AMERICAN EXPORTER. A treaty between the United States and the Empire of Ethiopia, opening for the first time friendly commercial relations, has been negotiated and signed. Emperor Menelik has also given his formal acceptance of the invitation to participate in the St. Louis Exposition. As a personal tribute from Emperor Menelik to President Roosevelt, Mr. Skinner has been charged to deliver to the President two lions and a pair of elephant tusks. Each member of the American party was tendered a decoration, the acceptance of which is held in abeyance, owing to the official character of the expedition. The closing audience granted by Emperor Menelik to Mr. Skinner and the leaders of the American escort was of a particularly cordial character.

William H. Ellis, of New York, who went over to visit Menelik II, of Abyssinia, returned on the steamship Majestic last month. He declared that the Emperor received him kindly, and said that of all the nations he welcomed America the most heartily, because he felt that Americans did not come to seek a part of his territory. Menelik received Mr. Ellis in his capital, Adis Abeba, and allotted him quarters in the royal palace. Mr. Ellis arrived with an escort of 200 men, and on leaving the country carried with him three letters from the Emperor. One was to President Roosevelt, one to Andrew Carnegie, thanking him for what he had done for the negro, and one to Mr. Ellis himself for the American people. Said Mr. Ellis:

"I am delighted with my visit. I found Menelik conversant with European affairs, and that he was eager for information regarding America and its development. He was especially interested in the colored race.

"He is about 58 years of age, light of color and of Anglo-Saxon features. He claims to be a direct descendant of the Queen of Sheba."

Canada's Trade Relations with United States.

FIGURES just made available throw interesting light on the trade between the United States and Canada. It appears that 52 per cent. of Canada's total foreign trade is with the United States. But the balance of trade is largely against Canada, for whereas 80 per cent. of all imports during 1903 came from the United States, Canada finds a market south of the line barely 31 per cent. of her total export. Nor under existing tariff conditions is this proportion likely to vary to any appreciable degree in the future. According to a Canadian authority, imports of United States products for Canadian consumption amounted during the fiscal year 1903 to \$128,795,237, an increase of \$14,047,135. Exports to the United States totaled \$67,766,362, an increase of \$1,199,527.

The Canadian authority discusses the situation in detail and concludes as follows: "Conditions, present and prospective, are therefore altogether favorable to an increased trade with the United States during 1904. That there may be a reduction in values is quite possible, but there is every indication that the volume of interchange will be greatly increased. This is certainly the outlook as regards imports. Canada should be a good customer for the next twelve months at least. The proceeds of the excellent harvest of 1903 are circulating freely; large outlays for the construction of railways, canals and other public works are assured."

Ready-Made American Cottages in Demand.

K. KENNEDY, United States Consul at Para, Brazil, makes an interesting report showing the appreciation of American manufactures in his district. In his report he says: "Within the past ninety days a large number of ready-made cottages reached this port from New York, and I am informed that many more of them are on the way. These will be erected on ranches and rubber estates, and if they prove satisfactory a very large demand for them will be immediately created. American vapor and kerosene launches are rapidly winning favor here. An order for ten small launches goes forward by the steamer which bears this report.

"American icemaking machinery has a complete monopoly of the Amazon from Iquitos, Peru, to Para—3,500 miles—and the business is a very important and lucrative one in this burning climate."

Growth and Future of Our Mexican Trade.

IMPORTS of iron and steel are the largest items of Mexican trade with the United States, and they increased most decidedly in the decade 1892-1902, is the report of James A. LeRoy, United States Consul at Durango, Mexico. Machinery alone jumped from \$1,500,000 in 1892 to over \$7,000,000 in 1903. Sales in these lines, responding to Mexico's industrial development, will likely continue to increase, but it may be doubted if they will gain relatively as they have in the past ten years.

"It will not do," Consul LeRoy adds, "to overlook the establishment of such concerns as the Mexican iron and steel plant near the 'iron mountain' at Durango, the very large, new steel plant at Monterey and the smelters at

Torreón and elsewhere. It is inevitable that a country waking to life as Mexico is should both learn from us and turn our conditions to her own advantage. The establishment of industrial concerns, such as cotton mills, shoe factories, etc., goes along with and stimulates an economic and social advancement and increases the call upon the United States for machinery, but the internal advancement in its turn leads the country, lately dependent on the outside world for more highly finished products, to seek to become again in a different degree independent and self-supporting."

Exporters in the Big Baltimore Fire.

BALTIMORE city's big fire last month affected some of the advertisers of THE AMERICAN EXPORTER. John B. Adt was one of those who fortunately escaped any damage. His stores and plant were left intact, and, of course, the filling of orders was uninterrupted, except for the day of the fire. Of others the Baltimore Badge and Novelty Company, the J. F. W. Dorman Company and the Delaware Oil, Gas and Development Company lost their plants through being in the path of the fire. The Baltimore Badge and Novelty Company was particularly unfortunate, as its plant had been destroyed by fire only a few weeks before by the big conflagration which leveled most of the business section of the city and had just been able to effectively resume business in temporary quarters. With characteristic enterprise all of these concerns began making arrangements for the resumption of business before the fire had subsided, and our foreign readers will be interested to know that any delays that may occur in filling their orders will be very slight comparatively. In fact, by the time this issue reaches our readers there will be no occasion for delay, for the enterprising managers of the concerns mentioned established temporary, but workable, quarters without the slightest bit of delay. It is pleasing to have on our list of advertisers men of such prompt action and indomitable spirit, for the Baltimore fire was a catastrophe which brought those qualities into effective service and our patrons were men equal to the emergency.

American Palace Railway Cars in Bavaria.

ACCORDING to a report from James H. Worman, United States Consul-General at Munich, Germany, the Bavarian Railway has just completed an American palace railway carriage from material imported for this purpose two years ago from the Pullman factories in Pullman, Ill. He adds: "This is the first railway car of the kind to be introduced into Germany and will no doubt be the forerunner of a regular system of luxurious railway carriages of this kind on German railways. The progressive character of the Bavarian Railway management is well known not only in this country, but in the United States. The chief of the bureau of railway management, General Director von Ebermayer, has visited the United States and is in thorough touch with American railway enterprises. The new minister of railways took office on January 1, 1904, in the department of railways, under the management of a separate minister, Minister von Frauendorfer, a man of like energy and enterprise, and there is reason to look for a larger introduction of American locomotives and palace cars."

Fostering International Trade.—"There is no country in the world which has so many trade journals as Germany," writes United States Commercial Agent Ernest L. Harris, Eibenstock, Germany. "The trade journal is a powerful organ for bringing producer and consumer and wholesaler and retailer together. What the trade journal accomplishes for the interstate commerce of any one country, certain journals now in circulation are accomplishing for international commerce. The American trade journals on file in the various consulates, chambers of commerce and other merchant organizations in Europe are unquestionably furthering the interests of our export trade. The advertisements in them may not always produce business at the outset, but they lead to inquiries along certain lines of manufacture which, if carefully answered, lead to the desired trade openings abroad."

Brooders and Incubators.—The Reliable Incubator and Brooder Company, of Quincy, Ill., U. S. A., recently issued its twentieth annual catalogue, which, as usual, is very complete with descriptions and illustrations of its incubators, brooders and poultry breeders' supplies of every description. Besides these, it contains much valuable information on subjects of great interest to all who raise poultry. It gives to breeders practical pointers, that would take years of experience to acquire. The company wishes each of our readers to have a copy, and will be pleased to send it free to those who will send their name and address, mentioning this paper when writing.

American Meat a German Necessity.—Simon W. Hanauer, deputy consul-general at Frankfurt, Germany, calls attention to a recent report of the Berlin Chamber of Commerce, which says in part: "Nothing can take the place of American bacon as a cheap and nutritious article of food for the masses of our population. Therefore it would be a matter of deep regret if the high import duties of the new tariff law were not reduced to a reasonable degree."

American Farm Implements for Austria.—American farm machinery does not find a ready sale here, but I am satisfied that many of our farm and garden tools could be successfully introduced if systematic efforts were made by our manufacturers to bring them to the general attention of Austrian farmers and gardeners.—FRANK W. HOSSFELD, United States Consul, Trieste, Austria.

"1900" Washing Machine

AND ITS PARTS.

Interior view, showing clothes in process of washing.

Looking under Bottom of Washer.

Inside view of Tub and Bottom of Agitator.

Shows Washer with the tub removed from the frame and the agitator or disk which rests on the clothes and water during washing. It also shows the wringer in position as when in use.

"1900" Washer.

"Domestic" Washer.

"Home" Washer.

"1900 Junior" Washer.

"1900" Washer.

A Remarkable Record!!! Reward of Merit!!!

Commencing in the year 1900 to manufacture the "1900" Washing Machine, we at that time "turned out" an average of Five Washers per day. During the month of August, 1903, we manufactured and sold OVER FOUR HUNDRED Washers per day.

A Remarkable Record!!! Reward of Merit!!!

The "1900" Ball-Bearing Washing Machines are the embodiment of the results obtained from over twenty-one years' practical experience in the making of washing machines, and, unlike any other washer upon the market, do not tear and wear the garment, but by the adoption of our agitator tosses and tumbles the garment through a whirlpool of water, thus forcing the water through the finest or coarsest fabrics, causing the clothes to become ABSOLUTELY CLEAN, without boiling or scrubbing, without wear or tear, and without the use of chemicals.

Washing
Machines.

Special Offer for Foreign Markets Only:

\$22.75

Upon receipt of Twenty-two Dollars and Seventy-five Cents in U. S. gold, or its equivalent, we will box, ready for steamer, and deliver F. O. B. cars at New York City, One of Each (Four in All), "1900," "1900 Junior," "Domestic" and "Home" "1900" BALL-BEARING WASHING MACHINES. Weight of the four machines, boxed, 340 pounds.

To facilitate our increasing export trade we desire to communicate with one responsible business house in each trade center of the world.

Tens of thousands of the "1900" Washing Machines have been sold in the United States, as well as in all parts of the world. Many of our agents at home are making over \$200 per month. Live men in your vicinity can do as well.

Orders received direct or through export houses; when ordering through the latter, to avoid errors, please mail us a duplicate of order. Our Illustrated Catalogue mailed postpaid.

The "1900" WASHER COMPANY
BINGHAMTON · NEW YORK · U.S.A.

ELECTRIC BURGLAR ALARMS.

Perfection in Dealing with Unwelcome Intruders Exemplified by an American.

ONE of the rich men of America is Giovanni P. Morosini, a thorough American, who believes in utilizing the inventions of the age to the fullest extent. Mr. Morosini does not fear burglars; in fact, he does not lock the doors of his mansion at night, although he lives on an estate far enough from New York City so that there is not a policeman on guard in front of or near domicile. Mr. Morosini, who is a retired banker, lives in quite an isolated locality on the bank of a great river, and he is sufficiently wealthy to tempt burglars to pay him a visit. Some account of the experiences and fate of such an intruder is interesting as showing the practical operation of devices which Americans have put into use. Presuming the burglar, says the *New York World*, pursuing the usual plan of "piping the lay" in the daytime, sees on the side fronting the Hudson River huge cannon and gaping mortars protecting Mr. Morosini's villa. What of it? They're all loaded, sure enough, and to the muzzle, at that—but with ice. They are magnificent ornaments and fine war relics, but of a type so obsolete as to put "the man behind the gun" in as great or greater danger than the man at the end that yawns. They are as formidable as cast-iron lions and papier-mâché dogs that guard some terraces.

"Easy," comments the burglar, as he surveys the big, spread-out mansion, with its coach-house and conservatories remote in case of alarm. "All windows and doors," he adds, gleefully. "Get in any old place." He may see a brick building at the rear of the grounds, but it looks a great deal like an ice-house, a toolhouse or a laundry. If he only knew it, that's the place that contains his undoing.

One of the side doors under the sheltering shadow of the massive porte-cochère is selected by the cracksmen as an ideal point of entry. Nothing better, for, from the lay of things, it leads into the big entrance hall, and there is no need of passing any rooms likely to be occupied. Then there is the great dining-room handy, with its heavy and valuable silver, the library just as easy of access, with its curios and relics, and the drawing-room, full of priceless ivories and bric-à-brac. Mr. Burglar gets to the door under the porte-cochère in fine style and on just the right kind of a night. It would be a shame to use a jimmy on such a fine bit of oak and plate glass as that vestibule door, so he tries the knob gently. It yields to his surprised touch; the door opens inward. Right here more senses than touch are treated to a jolt of amazement. As the door swings in every electric light in the halls and principal rooms of the mansion bursts into light and the interior of the house is illuminated as if for a grand fête. At the same time the lights about the grounds flare into all too prominent existence. Also, far up on the roof a huge brazen clangor arises that is fit to awaken the neighborhood for a mile around. It sounds for all the world like the self-proclamation of a locomotive bell on a very important train bustling into a big terminal. With the best reason, too, for it is a locomotive bell, hung hidden between two great chimneys, and it will keep on ringing until somebody throttles its clamor by turning a switch.

If Mr. Burglar is a sprinter, he will take a chance on a hot-foot dash through the hedge and a toboggan down the hill that sweeps around to the station platform. If he lingers he will find himself at the wrong side of a busy party of skirmishers, with very able and accurate guns ready for business. The same swing of the door that made things all light, but not merry, has jangled news of his arrival into the butler's quarters, and to the coach-house, where the stable hands sleep, and the greenhouse, where the gardeners were aroused from their slumbers.

It would have been just the same if the burglar had elected to become a guest of the Morosinis by forcing a window. He would have broken an electric circuit that would turn on the illumination display and set the bells ringing, quite as readily and as disastrously. Or, if he had, with the cunning of his craft, tried to avoid burglar-alarm electric connections by the well-known method of cutting through the glass it would have amounted to the same thing. The windows are of the cathedral type, with small panes, heavily leaded. But in the leads are secreted fine wires full of electricity. He couldn't make an aperture big enough to enter without cutting across a lead and thus severing a wire.

It has cost Mr. Morosini a lot of money, time and thought to make such ample provision for the elaborate welcoming of cracksmen. For instance, there's the heart of the whole system, the red brick, one-story building that might be a laundry, but isn't, because it's a power-house, with a remarkably fine installation of electricity. This power-house is an essential at Mr. Morosini's suburban estate, but in the cities the necessary electric power is supplied for those who use such alarms by the public light companies. The latest improved systems are so constructed that even electrical experts cannot tamper with them without giving the alarms. Nothing short of blowing up the power-house with dynamite would put the service out of business, and that incident would put the alarm in operation and enable persons affected to provide other and temporary means for protection until the system could be put in effective operation once more.

American Auto-Boat for Kaiser.—It was learned authoritatively last month that a new automobile boat for the German Emperor, designed by Charles F. Herreshoff, will be built in America.

Newspaper's New Building an Electric Marvel.

THE growth of the newspapers of a country bears a close relation to the general prosperity of that country, and in the case of the *New York Times* it has become necessary for its owners to erect a vast new building. When finished, the structure will be next to the tallest in New York, measuring 440 feet in height from the base of the steel-work. Aside from its great height it will present many novelties. In fact, it will be an electric marvel. It will combine a greater number and a greater variety of uses for electricity than any other structure. Steam will be an unknown quantity in the building for the greater part of the year, as it will be used only for heating purposes, and at a pressure of less than five pounds. The dust brush and the traditional broom of the office sweeper will be banished. New ideas, new methods, will prevail. These unique features are incidents that were evolved in the solution of a difficult problem.

Electric power will be furnished from a public station outside of the building, saving a great area of space and effecting economy of operation. This outside electrical supply will furnish power for 109 motors, rated at 900 horsepower, light for 4,000 incandescent lamps, 15 arc lights, 1 searchlight, signs, bulletins, Cooper Hewitt lamps and for many novelties, aggregating the use of current amounting to more than 400,000 kilowatt hours per annum.

Electrical novelties will be found in unlooked-for places. The presses will be equipped with the Kohler system of control, which permits of a movement delicate enough to turn the printing cylinder one-eighth of an inch per second, or at a speed of four revolutions per second. The automatic control and stoppage of machinery extends through the presses, autoplates, house pumps, sewage pumps, air vacuum pumps and the air-compression pumps, in order that current may not be wasted.

The barber shop promises innovations that are sanitary and satisfying. Some of the latest shops have appliances for using what is practically a blow-pipe on the hair, scattering fine particles into the surrounding air. The vacuum system completely reverses that idea, providing treatment that is most pleasing and decidedly sanitary. Instead of brushes for clothing, hats and shoes, the suction arrangement promptly and effectively removes all dust from clothing and sends it with all dust from the building into a receptacle that will be collected once a day. The woman who scrubs the floors will abandon mops and remove all the soapy or rinsing water by the suction of a pipe which has an opening eight inches long and one-sixteenth of an inch in width.

Apart from the dust and noise and annoyance of present methods, there is a material saving to carpets and furnishings, all of which are aerated as well as cleaned. The particles of dust and disease germs that would otherwise float and fill the air disappear in the tube, and a service which has hygienic as well as commercial value is rendered. The newspaper equipment—linotypes, presses, type cases, desks and furniture—will be dusted and cleaned by this system, which will do away with brooms, brushes, pails and dirty water.

This Light Comes from Mercury and Electricity.

FROM Rotterdam comes a request for information about the Cooper-Hewitt lamp, which has previously been described and mentioned otherwise in these columns. The lamp may be said to be something between an arc and an incandescent arrangement, although literally it is mercurial vapor made luminous. A glass tube of, say, two inches diameter and four feet in length, although it may be of any size within limits, with a ball blown on one end. Wires are fused into top and bottom, and in the lower end is placed a quantity of mercury. The current converts a portion of the mercury into vapor, which rises in a luminous stream to the bulb at the top; where it is condensed and falls back to the bottom. This continues as long as the current passes, and as there is no destruction of the mercury, the lamp should have a long life, although just how long remains to be seen.

The light includes only the two lower rays of the spectrum, the blue violet and the green; hence not only is there an absence of everything red, but also a reversal of every shade into which red enters. Visually, of course, this is a serious objection to the general use of the mercurial vapor lamp, nor can it come into anything like general use until a method is found to supply the lacking ray. One of the methods to supply the lacking red is to run some red incandescent lamps in connection with the Hewitt lamps. Photographically, however, the red is not missed, as, although even the ordinary plate is to a certain extent sensitive to it, it is so slightly as not to take any part in the exposure of portraiture.

New Combination in Packing.—The Smooth-On Manufacturing Company, Jersey City, U. S. A., has issued a new booklet, describing the various applications of its compounds, including a new one that will be of interest to those concerned. The booklet will be sent free to readers of *THE AMERICAN EXPORTER* on application to the company.

British Collieries to Use American Machinery.—Two important British collieries are to be equipped with American electrical machinery. The Ashington Coal Company has ordered a motor generating set. The Blaensychan colliery, located in the vicinity of Pontzpool, Wales, is to be installed with generating equipment.

Patch Electric Floor Surfer and Polisher.

The Patch Electric Floor Surfer and Polisher is a device to dispense with the labor usually employed in dragging heavy weights over tile and mosaic floors to produce an even surface. It is also serviceable for polishing large granite and marble surfaces, and sanding wooden floors. The motor is 2-horsepower, and will be furnished any voltage required. The voltage required should be particularly mentioned when ordering. The surface wheel is 20 inches in diameter. The sand box and water tank are conveniently located, supplying either sand or water as desired. The truck wheels have a heavy rubber tire, thus preventing marring the surface. The machine is shipped ready for immediate use. Gross weight, crated, 900 pounds. Net weight, 800 pounds.

A DOUBLE ANNIVERSARY.

Edison Tells About the Birth of the Incandescent Light Twenty-Five Years Ago.

ONE of the most interesting events in America last month was the double anniversary which was celebrated by Thomas A. Edison, under the auspices of the American Institute of Electrical Engineers, at a dinner at one of the great hotels in New York City. Mr. Edison celebrated both the fifty-seventh anniversary of his birth and the twenty-fifth anniversary of the day on which he gave to the world the incandescent electric lamp. At the banquet he was praised by the best electrical experts of the United States, while messages of eulogy came to him from the savants of the Old World, until he hung his modest head and only consented to utter his thanks at last by ticking them over one of his beloved telegraph wires. After such distinction perhaps only a man of Edison's energy and perseverance or of his thorough absorption in the work that has engrossed his whole life and blossomed with such notable accomplishment could have been found early next morning toiling as usual in his laboratory.

In the quietude of a little New Jersey village he was found by a New York *Herald* reporter sitting amid his jars and wires and kettles experimenting on new wonders. He is always reluctant to celebrate himself, and it was only when he had been convinced that the world was entitled to know the beginning and development of the invention for which he was honored on Thursday night that he consented to talk.

The narration was almost as marvelous as the achievement it described, and it contained matter never before made known to the world, or, if made known at all, only to a few experts. Its interest is enhanced by the fact that the finished article from his hands is now in use in every country of the world.

"Singularity enough," said Mr. Edison, "one of the first establishments in the world to adopt the incandescent lamp was the *Herald* Building in New York. As soon as its practicability had been demonstrated a complete plant was installed. Again, the *Jeannette*, which the *Herald* sent on an exploring expedition to the North Pole and which was lost in the Arctic regions, was also equipped with the new lamp, and somewhere in the icy depths where she reposes perhaps she still illumines the waters of the deep."

Then he told the story that sounds like fairy lore, or would sound like it had not mankind become used to the necromancy worked by the quiet, white-haired man who sits in the seclusion of the Jersey wilds, day after day, from early morning until after midnight, experimenting with the currents that in less familiar hands would be deadly.

Before launching into it, however, he was asked if he was now at work on any new inventions.

"Lots of 'em," he answered in his laconic fashion.

"Won't you let the world know what more it is to expect from you?"

"Nope," he said, in the same manner, "except for the storage battery I'm trying to perfect, and that's pretty well known."

"That is the one you design for use in automobiles?"

"Yes. The present one is of no use at all. It doesn't last more than eight months or so. I'm trying to get up something that will take the place of horses everywhere."

"Will it be more expensive than the one now in use?"

"Well, in the beginning it might be a little more expensive, but what's the difference, when the present system is no good, and this one, after it is perfected, will pull more tons for less money?"

"What do you think is the future of wireless telegraphy, if it has one?" was the next question.

"Certainly it has a future, and I think Marconi will do great things with it. We no longer consider it strange that ships should talk to one another from distances of six or seven hundred miles, and, as a matter of fact, wireless telegraphy is now being used all over the world. But its immense value will not be fully demonstrated until it has come fully into commercial use, and Marconi's first aim, to the exclusion of everything else, should be to get his producing stations open and in working order.

"By the way," continued Mr. Edison, breaking off as though loath to talk of the things with which he was most familiar, "talking about the other side of the world, I see that the Japanese are doing great things. Well, they are great fellows. I used to have a lot of them working for me here. They're energetic, inventive and experimental—that explains their success against Russia."

Edison's electric light, incredible as it may appear, is produced from a little piece of paper—a tiny slip of paper that a breath would blow it away. Through this little slip of paper is passed an electric current and the result is that light now so carelessly made to come and go at will by persons who little think of the eternal mystery of it.

Naturally, the first question propounded when this fact was made known was how the inflammability of paper was to be overcome. The answer was seemingly simple. Edison made his paper more infusible than platinum and more durable than granite. Even this involved no complicated process. The paper was merely baked in an oven until all its elements had passed away except its carbon framework. This was then placed in a glass globe connected with the wires leading to the electricity producing machine and the air exhausted from the globe. Then the apparatus was ready to give out light without flame, without danger, requiring no matches to ignite and free from all flickering.

The *Herald* tells this interesting story of the birth of the incandescent

light, following an account of other experiments: "A spool of cotton thread lay on the table in the laboratory. Edison cut off a small piece, put it in a groove between two clamps of iron and placed the latter in his furnace. The satisfactory light obtained from the tarred lampblack had convinced him that filaments of carbon of a texture not previously used in electric lighting were the hidden agents with which to make a thorough success of incandescent lighting, and it was with this view that he sought to test the carbon remains of a cotton thread.

"At the expiration of an hour he removed the iron mold containing the thread from the furnace and took out the delicate carbon framework of the thread—all that was left of it after its fiery ordeal. This slender filament he placed in a globe and connected it with the wires leading to the machine generating the electric current. Then he extracted the air from the globe and turned on the electricity.

"A beautiful light greeted his eyes. He turned on more current, expecting the fragile element instantly to fuse, but the change was only a more brilliant light. More and still more he turned on, but the delicate thread remained intact. Then, with characteristic impetuosity, and marveling at the strength of the little filament, he turned on the full power of his machine and eagerly watched the consequences. For a minute or more the tender thread seemed to struggle with the intense heat passing through it—heat that would melt the diamond itself—until it succumbed, and all was in darkness. The powerful current had broken it in twain, but not before it had emitted a light equal to that of several gas jets.

Edison hastened to examine under the microscope this curious filament, apparently so delicate, but in reality much more infusible than platinum, so long considered one of the most infusible of metals. The microscope showed the surface of the filament to be highly polished, and that its parts were interwoven. It was also noticeable that the filament had obtained a remarkable degree of hardness, compared with the fragile character before it was subjected to the action of the current. Night and day, with scarcely rest enough to eat a meal or catch a brief repose, Edison kept up his experiments.

"From carbonizing pieces of thread he went to splinters of wood, straw, paper and many other substances never before used for the purpose. The result showed that the substances best adapted for carbonization and the giving out of incandescent light was paper, preferably thick, like cardboard, but giving good results even when very thin."

Edison began life as a newsboy, later he became a telegraph operator, and his life story is one of interest. Pages of *THE AMERICAN EXPORTER* could be filled with it.

Mule's Last Stand Against Electricity.

ELECTRICITY has displaced the mule in transportation service in America at all points except for the haulage of canal boats. Here, however, considerable progress is being made. On one of the largest canals the boats are now towed by electric cars running on tracks along the old towpath. Recent tests on another canal have tried an "electric mule" or motor-driven carriage. This "mule" travels along 18-inch continuous plate girders suspended above the ground on posts, and forming a track along the side of the canal. The "mule" is equipped with two 40-horse-power motors, taking current in the usual way by overhead trolley. These are geared down by double reduction motors to low speed. The tests included hauling two to four canal boats, each loaded to 200 tons, at a speed of four and a quarter miles per hour. The pull was very steady and progress very uniform and much more rapid than animal traction. No wash of the canal banks occurred, as the slight wave motion from the boat died out before reaching the banks. This method is therefore superior to the use of propellers on canal boats, which cause considerable wash.

Electric Novelties on Ocean Steamships.

A LIST of the electrical equipment of a modern ocean greyhound, if written out in full, would look like the catalogue of a supply house.

One of the novelties is an electric griddle cake and waffle range. The automatic egg boilers, like those on the Atlantic steamship *Oceanic*, are designed to cook 200 eggs at once, a clock arrangement causing the basket containing the eggs to hop out of the water at any half minute up to six minutes. Another novelty is a self-dumping oyster cooker for stews. At the termination of a given time the cooker pours its contents into a soup plate and automatically shuts off the electricity.

Paris Adopts American Electrical Apparatus.—The Paris Underground Railway authorities have decided to abandon the use of power cables carrying large currents through the train, and have awarded a contract to American electric interests for 100 complete equipment of electro-pneumatic turret type control apparatus to replace the present system.

American Equipment Chosen.—Contracts for the additional steam plant have just been let by the New South Wales Government for the power station of the Sydney city and suburban tramways. The lines already in operation are about 70 miles in length. More are being built. The initial equipment of the plant will be furnished by American firms.

Cary's Universal Box Strapping.

Made of Soft Steel through which nails can be easily driven.

Put up in coils of 300 feet each and packed 20 coils in a case.

Made in four widths, viz.:

$\frac{1}{2}$, $\frac{5}{8}$, $\frac{3}{4}$ and 1 inch.

Patented in all countries.

Packed very securely for export.

CARY MFG. CO. 19 & 21 Roosevelt St., New York.

Cable Address: "CARLEIO."

Codes used: A B C, 4th Ed.; A B C, 5th Ed.; Western Union.

LOZIER MARINE GAS ENGINES

Two-Cycle, 3 to 15 Horse-Power. Four-Cycle, 15 to 100 Horse-Power.

SIMPLE
IN DESIGN.

ECONOMICAL.

QUIET
AND POSITIVE
IN ACTION.

"AN IDEAL
GASOLINE
ENGINE."

Lozier 25-foot 5 H.-P. Launch.

Accepted as the Standard and Most Popular Gasoline Engine in the United States of America and Now Being Adopted Throughout the Entire Civilized Globe.

We build Open, Half-Cabin or Full-Cabin Launches from 12 to 62 feet in length.

The Lozier 20-Horse-Power Four-Cycle Engine.

Our Catalogue, thoroughly describing and profusely illustrating our Engines, published in the English, Spanish, German, French, Italian, Swedish, Danish and Finnish languages, mailed postpaid to all parts of the world.

THE LOZIER MOTOR CO., 1 BROADWAY, NEW YORK, U. S. A.

Cable Address: "LOMOCO," New York.

The "New American" IS THE Turbine for Export. Why?

Strength, durability and interchangeable parts reduce repairs to a minimum.
Great power for the diameter.
Economy in use of water.

Vertical or Horizontal Installations to meet requirements.

Our Catalogue, which will be mailed on request, furnishes detailed description. We also manufacture Gas and Gasoline Engines, Paper and Pulp Mill Machinery, and a full line of Power Transmission Machinery.

THE DAYTON GLOBE IRON WORKS CO.,
DAYTON, OHIO, U. S. A.

THE IMPROVED United States Cream Separator

WAS AWARDED

GOLD MEDAL (The Highest Award) at the Pan-American, Buffalo, N.Y., U. S. A.

GOLD MEDAL, Paris Exposition, Paris, France, 1900.

U. S. Separator, Dairy Size, 1/2 lb. Frame.

And the official records show that in the Model Dairy at the Pan-American Its Work Excelled Everything, averaging .0138 for 50 consecutive runs, and won World's Record for practical every-day work.

The United States Separator stands without a peer, the most thorough Separator made.

Dairy size U. S. Separators run easily by hand but can be operated by power if desired. Capacities range from 150 to 700 lbs. an hour.

Prices from

\$50.00 to \$165.00.

Large illustrated catalogues sent postpaid for the asking. Orders received through export commission houses.

Please mail duplicate order to us.

Cable Address: Vermonfarm, Bellows Falls, Lieber's, W. U. Int. and Commercial Codes.

The New "Liquid Sunlight."

RADIUM made in America from mineral found in Colorado was shown recently at a meeting of the Technology Club, of New York City, and the latest development in the treatment of disease by the use of liquids charged with radio-activity was described by Dr. William J. Morton, of the New York Post-Graduate Hospital.

"Liquid sunlight" is the name given to fluorescent compounds which may be taken internally, and which will, it is asserted, have remarkable curative effects in cases of cancer, malaria or any disease due to bacteria. It is the latest development from the use of radium in medicine, and Dr. Morton's announcement of results that he has obtained with it was listened to with great interest by several scientific men. Among those present were Professors Hallock, Tucker and Sever, of Columbia University.

George F. Kunz exhibited the American radium, which, he said, was made by Professor Phillips, of Princeton, in his laboratory, from ore found near Silver City, Col. The specimen was of 1,500 activity. It caused a large diamond to glow in the dark and made other minerals luminous. Mr. Kunz also exhibited a small specimen of actinium, a newly discovered mineral having the same properties as radium, and which was described in a recent issue of THE AMERICAN EXPORTER. He said that the specimen was the only one in this country.

"We are coming to a broader conception of what disease is, and what curative agencies are," said Dr. Morton in his address. "Physicians are gradually dropping old medicines, and there is a growing tendency to treat disease from a physical standpoint. That is the case with the use of radium. It is a physical force and is similar to the Röntgen ray in some respects. We can, however, use radium in many ways not possible for the X-ray, and when we know more about it we shall undoubtedly accomplish results that even now seem impossible.

"If we had radium of 100,000 activity, which we soon shall have, we could do much more than with that which we now possess, which has about 7,000 luminosity. One of the greatest benefits is the use of radium for internal treatment. We have tubes containing radium with which cancer of the throat has been successfully treated.

"I have experimented for six months with solutions which become radioactive when exposed to radium for twenty-four hours. To give these solutions in very large doses would probably kill a human being, and great care must be exercised in these experiments. Sunlight is, as everybody knows, a great curative agent, and liquids charged with violet rays have practically the same effect.

"A later method is to employ solutions like quinine sulphate that have a property of fluorescence. A patient may be given some of this solution, and then when radium is held near the body or the X-ray used, the liquid becomes luminous and sunlight may be said to flood the interior of the body. In chronic malaria, cancer of the liver and many other ailments this treatment has already shown good results. It is like placing an ultra-violet molecule cheek by jowl with a diseased cell—benefit is certain to follow."

Dr. Morton said the healing properties of many mineral springs which have been attributed to the chemicals in the waters may be due to imprisoned sunlight. He mentioned several cases of cancer of the face and throat which he has cured by the use of radium.

Steel Cars for New York's New Subway.

STEEL passenger cars are nearer to a realization than we believed, when in a recent issue of THE AMERICAN EXPORTER the subject was discussed.

The cars originally designed for New York's new subway rapid transit system were described long ago in these columns, but it seems that the Paris subway disaster caused the constructors of New York's new system to delve deeper into the problem of safety. Last month they brought forward a specimen of an all-steel car which the electricians of the system and expert car builders are confident combines absolute safety against fires, and 200 of them have been ordered for the subway. The original copper-sheathed cars, 300 of which have been built, will be used upon the elevated railroads, which are controlled by the same corporation.

There are admitted to be many difficulties to be overcome in an all-steel car, and the experts of the company declare that they are confident the most important already have been successfully met. They say they are warranted in predicting that these are likely to be the future type of cars for railroad travel, both underground and surface. George Gibbs, the consulting engineer of the system, declared that the problem of settling on a type of car to be used in carrying millions of people through the subway at express train speed had been one of the hardest to be met by the subway constructors. Mr. Gibbs is himself the inventor of the all-steel car which has now been ordered. It was necessary to secure a car which should be absolutely fireproof, so as to prevent a disaster here such as that of last summer in the Paris subway, where the burning of wood in the subway cars led to the stampede and the suffocation of passengers. In the steel cars now ordered there will be no wood used and no inflammable material, save possibly the rattan seats.

"In the spring of 1902," said Mr. Gibbs last month, "it became my duty to design suitable car equipment for the subway lines of the Interborough Company. The various types of cars in use throughout this country and abroad were examined and a general type and size were adopted, with a view to meet subway limitations and conditions of operation. The problem of the

proper protection of passengers in case of accident or derangement of the electrical apparatus received special attention, and all available materials of construction were considered with reference to their suitability. The possibility of building a passenger car of metal entirely is considered by us now to be the eventful development of the passenger-carrying vehicle. Such vehicles have not been placed in use in any part of the world, and the design has involved radical departures from known practices."

Consulting Engineer Gibbs explained that there would be no danger of passengers receiving a shock from escaping electricity in case of a "short circuit" or other accident. It is claimed that the steel car forms the best "ground," and that escaping electricity, instead of going into the frame steel work of the car and thus causing shock will find its way back to the ground and all the fuses and circuit breakers will be opened, making the section of the third rail "dead," thus preventing the electricity from continuing to escape through the body of the car. The interiors, which will be arranged much the same as the present elevated cars, will have an aluminum finish. The seat frames will be of steel.

American Genius Ameliorates Deafness.

MENTION has previously been made in these columns of the invention perfected by a young American electrical engineer, whereby deaf persons were enabled to exercise the sense of hearing. The apparatus seems to have stood the most severe tests satisfactorily, and in a recent issue of *The Onlooker*, a British publication of influence and importance, proper credit is given for the achievement accomplished by the American inventor. *The Onlooker* estimates that in the British Empire alone there are 2,000,000 people who are more or less afflicted with deafness, and further declares that the number is increasing every year. Its editor, therefore, considers that the young American engineer has performed a world-wide public service in perfecting his apparatus, which it describes as "an adaptation of the telephone microphone" and which is called an acousticon. The instrument consists of three parts, a receiver, an ear-piece and a battery which are connected by wires. The duty of the receiver is to act as an outer ear in collecting the sounds, and, to a certain extent, assorting and accentuating them. One of its surprising properties is its power of modifying the sounds which it receives, so that on the acousticon loud reports are modified, while the merest whisper is intensified and reaches the sense of hearing as distinctly and emphatically as a loud one. The sounds collected by the receiver pass to the ear-piece, which carries them direct to the nerve centers of the inner ear, whence they reach the brain by those vibrations which we know ourselves as sounds. *The Onlooker* says:

"Reports of the wonderful results attained by this instrument, vouched for by men of science, whose reputation is a sufficient guarantee of their credibility, have long reached us from America. During the inventor's visit to this country he was no less successful. In Derby, before the Duke and Duchess of Newcastle, he exhibited his invention in the Institute for the Deaf and Dumb, when the audience was so impressed by the success he attained that they immediately started a subscription for a fund to supply the poor with this instrument. It is an open secret that the Queen, whose great interest in every advance for the relief of suffering is so well known, was greatly impressed by this invention and took the keenest interest in the demonstration which he gave at Buckingham Palace. One of the most striking uses of the acousticon is its usefulness in teaching deaf mutes the use of speech and articulation. At the end of half an hour's instruction a girl was able to articulate some words accurately at will. Friends who accompanied her, and had never heard her utter an intelligible sound in her life, looked upon the successful treatment as verging on the miraculous."

American Autos to Make Mile in Thirty Seconds.

BARNEY OLDFIELD, the American automobilist, speaking of the marvelous advances which our automobile mechanics are making, said the other day: "The mile will be made in thirty seconds within two years. I do not believe that the thirty-second mark will be struck within a year; still it may be reached. I predict that within a year they will go under thirty-five. In fact, I am after that record. Of course, others may reach it, for there are a lot in the field now—men of means and nerve, who have the time and inclination to buy cars and drive them.

"I want a car built for my use with which to make the try. The car as it is built to-day will not do that. The racing car for thirty-second mile must be built low. It must all be figured out by scientists carefully and planned in every way for this particular sort of straightaway work. The right car will not be useful for anything but just straightaway work. It must be built of the least wind resistance—low and scooped-shaped—so the driver is inside the car and out of the wind himself.

"It may readily be seen then that the building of a car to go under thirty-five will not be such hard work as might be supposed. But for every second under thirty-five there will have to be very marked improvement and scientific changes.

"Of course, when they travel thirty seconds to the mile, or a matter of 176 feet to the second, there will be danger. I have predicted a death or two at such speed, and they will come, but that will stop none of us from trying, for think of the good things awaiting the man who goes the mile in half a minute, or a speed equal to the fastest locomotive!"

Double Engine Traction

In THREE Sizes:

20 H. P. - Weight, 9½ Tons
 25 H. P. - Weight, 10½ Tons
 30 H. P. - Weight, 11¼ Tons

Boxing for Export will increase weight 20 per cent.

Hauling Capacity, - 15 to 25 Tons,
 BESIDES FUEL AND WATER.

These Engines Always Give
 Maximum Power.

They use
 Wood,
 Coal or
 Straw
 for fuel.

TORONTO ENGRAVING CO.

Where the reduced speed
 of a single engine will stall
 it, the Double Engine
 walks right along.

Wheels (22 to 28 inch face)
 shown are for Threshing
 and Plowing Traction.

Special Wheels
 for Freighting.

Boilers are of ample size.
 With indifferent fuel under
 severest stress will blow off.

Engines on "belt-brake"
 show easily 40 to 60 per
 cent. increase in power over
 above rating.

MONSTER SHIP LAUNCHED.

American Giantess Christens New Giant Freight Carrier for Pacific Trade.

THE greatest event of February in the United States and perhaps in the world, so far as peace and progress are involved, at least in a commercial sense, was the launching of the new steamship *Dakota* on the banks of the historic Thames River, in the State of Connecticut, on the Atlantic coast of the United States. The *Dakota* is a giant among ships and is a twin sister of the *Minnesota*, which was launched last spring and described in *THE AMERICAN EXPORTER* at the time. The *Dakota*, giant that she is, was christened by a giantess, Miss Mary Belle Flemington, who hails from the State of North Dakota, which gave the ocean giantess her name. Miss Flemington is only 17 years old, but stands 6 feet 2 inches, and as she broke the bottle of wine against the ship seemed to typify American womanhood as being great in no less a degree than its representative giantess who officiated at this interesting event.

In our issue last May we printed a description of the *Minnesota*, twin to the *Dakota*, but as it may not be convenient for our readers to refer back it may be said briefly that the *Dakota* will carry 2,700 passengers and a crew of 300 men, in addition to cargo amounting to 22,000 tons on a draught displacement of 30 feet. The two ships are the largest cargo carriers in the world and are the largest vessels ever built in America. The *Minnesota*, launched last April, will make her trial trip the coming July and the *Dakota* will be completed in September. Some idea of the size of these ships can be obtained, when it is stated that they are 630 feet in length, lacking only a few feet of the length of the Kaiser Wilhelm II and other fast Atlantic vessels, while their breadth of 73 feet and molded depth of 56 feet place them far ahead of anything afloat for cargo carrying capacity. There have been 22,000 tons of steel used in the construction of each ship, and the rivets used on each hull weighed 375 tons.

The *Dakota's* launching was made a great affair. James J. Hill, president of the company which built the vessels, and who has great faith in the expansion of our commerce over the broad Pacific Ocean, where the *Minnesota* and *Dakota* are destined to ply, had this to say, in part, to the assembled guests:

"I want to thank you all for the sympathy and support you have given us by coming to witness the launching of the *Dakota*. Some of the people in Wall Street seem to be willing to furnish us with what they call a merchant marine. They have merchant marines and navies and such things to sell. But somehow or other the ships we can get that way are not laden with gold. They turn out to be no good. If we want good ships we must build them ourselves. Every standard of life in our country is highest and better than it is anywhere else, except one thing, and that is transportation. Transportation is the problem which confronts the industrial future of this country. If we would gain and keep the markets of the world we must furnish cheap transportation. If we fail in this, these great sister ships which you have seen, the *Minnesota* and *Dakota*, will soon be for sale—and I mean s-a-l-e and not s-a-i-l. I mean they will soon be under the hammer of the auctioneer.

"The problem of inland transportation was a hard one, but we have solved it. The problem of transporting goods across the Atlantic was difficult, but we have at last made a good start at solving it. The problem of conveying the product of our rich and fertile land across the Pacific is most difficult of all. I'm not afraid to tackle it. All I'm afraid of is a fire in the rear. I hope and believe we will soon have more ships on the Pacific. I hope and believe we, in America, will not adopt that malady which they call in Britain 'physicalitis.' I hope that those who control the affairs of this nation will always realize that the conquests of commerce are a hundred times more to be desired than the conquests of war."

Many other speeches were made by distinguished men.

Another Big Ship for Transatlantic Service.

THE new steamship *Baltic* is expected to make her maiden voyage to New York in June, and her advent will mark another step in the progress that is being made in improving transportation facilities between the Old and New Worlds. The *Baltic* is the largest ship ever built, being nearly three city blocks long. She is 25 feet and 9 inches longer than the *Cedric*, which previously held the record for size, and exceeds that vessel in gross tonnage by 2,000 tons. The dimensions of the *Baltic* are as follows: Length, 725 feet, 9 inches; breadth, 75 feet; depth, 49 feet; gross tonnage, 33,000; capacity for cargo, about 28,000 tons; displacement at load draft, about 40,000 tons.

Like the *Cedric*, the *Baltic* is not designed to break speed records, steadiness being the aim sought. She will be fitted with engines of the quadruple expansion type and of about 13,000 indicated horse-power. Her speed will be about 16½ to 17 knots, and she will cross the Atlantic in about eight days. The *Baltic's* great size will make it possible to add improvements even beyond the other vessels of her type. There will be accommodations for nearly 3,000 passengers, besides quarters for a crew of about 350.

In addition to the ordinary staterooms there will be suites, consisting of bed, sitting and bath rooms; also single-berth staterooms. One of the most notable features will be the grand dining saloon, a handsome apartment situated

on the upper deck. It will extend the full width of the ship—75 feet. It will be exceptionally lofty and airy, and will contain seating accommodation for 370 people. With its domed skylight and artistic and effective decoration this will be one of the most magnificent dining saloons on the Atlantic.

A New Device to Aid Mariners at Night.

MANY improvements have been made in Lord Kelvin's compass and sounding machine, according to reports received at the United States State Department. In the newest form of the compass the illumination is effected from below, and either oil lamps or electric light may be used. The bottom of the compass bowl is in the form of a strong, thick lens, through which the light is refracted on the card. The intensity of the light may be varied at the pleasure of the observer, and this is found to be exceedingly useful in taking the bearing of stars or other faint lights.

A new anti-vibrational suspension has been designed, which insures great steadiness in the card, and a new form of helmet, with rifle sights, facilitates the work of taking bearings. With the new helmet navigators are able to take bearings of lights and stars by night with the same ease and convenience as bearings of the sun are now taken by day. The new form of sounding machine has been constructed of a height which has been found from practical experience to be the most suitable for the work of winding in the line. In addition to this great advantage, the new machine has an improved form of brake action, and a further advantage is that the working parts of the machine are all in sight and can be easily removed if necessary.

Motor Boats Make a Great Show.

THE first February exhibition of motor boats held in New York was quite as great a success as the January automobile exhibition. The advances made in the motor-boat industry in America in the last two years have been marvelous. There were thirty exhibitors, seemingly few but really many when one considers that the industry is still in its infancy. One of the new inventions shown was a motor devised by an American. The motor is moved by gasoline, but the motor does not whirl a propeller. The power is applied to eight paddles, which work on a slide and fulcrum inside the bottom of the boat, the blades being in the water beneath the boat's bottom. The inventor says that by this method of propulsion the propelling blades do not push the water away from the boat, but push the boat away from the water. It is claimed that this particular craft can show a speed of eighty miles an hour.

One of the decided novelties was the application of the popular gasoline explosive motor to an iceboat. The substitute for sails is a wheel with sharp teeth, which engage the ice. The inventor modestly admits that his first power iceboat is a bit crude, but in its trial trip it made forty miles an hour. He is designing improvements toward increasing the factor of safety. He thinks the matter of speed will take care of itself and doubts if there is any limit to it.

Fastest Automobile Launch in the World.

THE honor of possessing the fastest automobile launch of its kind in the world rests with this country. This boat is the *Vingt-et-Un*, which has been challenged to a match race for a \$2,000 cup this season. The boat had its trial trip on the Hudson off Yonkers, in the State of New York, in November and developed the remarkable speed of a mile in 2.26, with the wind and tide, while against the wind and tide it did three minutes exactly. At the greatest speed the rate was a little over 24 miles an hour. The boat is 30 feet long and is equipped with a 21 horse-power four-cylinder motor, placed well forward, practically in a separate compartment, which is covered when the motor is in use. One man steers and controls the engine, and the cockpit will hold about three or four persons. The boat carries 25 gallons of gasoline, which is said to be sufficient to carry it 300 miles. The total weight of the boat, with the engine, is 770 pounds. The craft was designed by Clinton H. Crane, who had designed some of the best and fastest of the small-class yachts in recent years.

Air Ship and Ice Boat.—One of the curiosities at the New York Motor-Boat Exhibition last month was a 15-foot model of the airship invented by Lawrence E. Dare, who has long been studying and experimenting in aeronautics. Mr. Dare believes his ship, when built on the model's lines, with a 60-foot turtle-shaped gas bag, will win a big prize at the World's Fair this year. He says that after he proves to the world that he has solved the problem of aerial navigation in practice he will make a practical light-hulled boat for his car that can be disconnected from his gas bag and navigate in water if the exigencies of aerial tours require it. The addition of runners, Mr. Dare says, would make a "scooter" of it, in case of an unavoidable descent upon frozen seas or floating ice.

Best Year in Export Vehicle Trade.—The United States Government's annual statistical report of our foreign trade shows 1903 to have been the banner year in the value of carriages exported, the figures showing an increase of half a million over 1902, the best previous year. The value of carriage exports for 1903 was \$3,514,363. The actual increase is larger than the figures indicate, because prior to 1903 wheelbarrows, push carts and hand trucks were included with carriages. The exports of these, amounting to \$175,671 in 1903, are now given separately.

Knock-Down Office and Home Furniture for Export. The "GUNN" K. D. Sectional Bookcases.

Top Section
List, \$3.00

9 3/4" Section
List, \$4.15

11 1/4" Section
List, \$4.50

13 1/4" Section
List, \$5.25

Base Section
List, \$2.65

THREE-SECTION CASE.

With top and base set up. Weighs 135 lbs. gross, 100 lbs. net, and of 6 1/2 cubic feet. This cut represents the entire line of sizes, and will make a case for 10 books or 10,000 books, growing as the books accumulate. Measurements are inside. All sections 10 1/4 inches deep and 32 1/4 inches long. Made of selected quarter-sawn oak and handsome polish finish.

THREE-SECTION CASE, as shown, complete - - - each \$10.76
SIX-SECTION CASE, as shown, complete - - - each \$17.98

IMPORTANT NOTICE.—To secure full benefit of above, even sample orders should not be for less than the steamship minimum for issuing ocean bills of Lading. Some steamship companies accept not less than 40 cubic feet, while others not less than 80 cubic feet. Six Three-section Cases occupy 40 cubic feet; Four Six-section Cases occupy 40 cubic feet. NOTE explanation of ocean freight on "Gunn" K. D. Cases: "An ocean rate of 10 shillings per 40 cubic feet equals a cost of eight cents per section, or about four per cent. on the cost boxed f. o. b. New York."

Specify "Gunn" when ordering. Orders received direct or through export houses. When ordering through the latter, to avoid errors, please mail us duplicate of order. Our catalogue, illustrating and describing the various styles of Sectional Bookcases and Filing Cabinets made by us, mailed postpaid.

THE GUNN FURNITURE CO., Grand Rapids, U. S. A.

Western Union and A. B. C. Codes used.

Cable Address: "GUNN," Grand Rapids.

We also make a full line of Roll and Flat Top Office Desks and Typewriter Cabinets.

A FEW REASONS WHY THE "GUNN" K. D. SECTIONAL BOOKCASES ADMIT OF DIRECT IMPORTATION TO THE TRADE.

The assortment is SMALL. All parts are INTERCHANGEABLE, making every possible size bookcase from the same stock. They require but little space in warehouses, as the cases are shipped K. D. (flat) and can be set up as required, with no tools but the hands.

Our method of boxing K. D. (flat) insures arrival of goods in PERFECT CONDITION, as NO POSSIBLE DAMAGE CAN OCCUR TO FINISH AND NONE OF THE PARTS CAN SWELL OR WARP, as in ordinary furniture. Deliveries can be made in thirty days, and by using our special code, twenty days.

ADVANTAGES OF THE LINE.

The field to sell is very large, as the same stock meets the demand from offices and public buildings, as well as for home use—in fact, anywhere an article is desired to be covered from dust and moisture. Each sale made is a guarantee of repeated purchases for additional sections, as books accumulate. The sections can be added, vertically or horizontally, to fit the wall and space. The glass doors, when raised, disappear, sliding on small frictionless roller bearings. The "GUNN" is the only case in which a broken glass can be replaced by simply taking off the door, and without removing the books or taking the case apart. The cases, when set up, present a handsome appearance, with no objectionable features, and are as rigid as an ordinary bookcase.

We GUARANTEE the "GUNN" SECTIONAL BOOKCASES PERFECT IN ALL RESPECTS.

Special Offer for Export Only:

The prices here quoted (U. S. gold or its equivalent) include boxing for steamer, and delivered f. o. b. cars at New York City.

"Gunn" K. D. Sectional Bookcase.

This cut shows our knock-down (flat) construction. It is put together without nails or screws, or dowel-pins; the irons that are fastened to the shelves have upper and lower tongues that fit in the grooves in the bases, center sections and top sections, thereby binding all rigidly together.

Fate of the Last Man on a War-Fish.

ALL of the nations of the earth are interested in the development of submarine torpedo boats, for the perfection of this branch of naval warfare will tend to eliminate battleships from international conflicts. In the course of construction and experiments in America with these new war-fish, as they may be called, several accidents have happened. It was therefore considered advisable to settle once for all the much-mooted question as to the possibility of the crew's escape in the event of one of these boats meeting with a mishap while submerged that would prevent its rising to the surface. Because of the practical impossibility of egress through the conning tower when it is subjected to an enormous pressure of water, as it would be at the bottom of the sea, it was thought that all in the boat would be lost in a contingency such as has been presented; but experiments made with dogs now have proved conclusively to naval officers that the members of the crew could be shot out of the torpedo tube without injury—that is, all could with the exception of one.

One man would have to stay behind to work the mechanism in order that his fellows might escape, and thus the question arises, What would become of the last man? In the opinion of the submarine boat builders, there can be only one answer—the last man would have to submit to being buried alive.

It is clear from this that some time an opportunity to display a new form of heroism may be presented to a naval man, an opportunity to save his fellows by rising superior to the terrors of a death that would creep upon him with maddening slowness. It would take a long time for the air in the boat to be exhausted, and then would come the lingering torture of suffocation.

The torpedo firing tubes are situated in the bow of the submarine boats and are about 11 feet long. At both the inner and outer ends there are water-tight doors. When a torpedo is to be fired it is inserted in the tube by opening the inner door while the outer door is kept closed. The inner door is then shut, the outer is opened, a man turns a lever that releases 50 pounds of compressed air and, whiz! out goes the torpedo. After that the outer door is closed the water in the tube is drained out, and the tube is ready for another charge.

The experiment of firing dogs through the tube was made recently on the submarine boat Shark in Narragansett Bay, U. S. A. Two large animals were used for the test. One at a time they were placed in the tube and a block of wood inserted behind them to make the "charge" fit snugly. The animals and the blocks were then expelled precisely as if they had been torpedoes. It was thought by some naval officers that the force of the compressed air charge would kill the dogs, but after their violent exits from the tubes they promptly rose to the surface and began swimming around as if nothing had happened. They were picked up and taken to the station, where they are now capering around as lively as ever.

A reporter who called at the office of the torpedo-boat company, which designed the nine submarine craft that the United States Navy has in commission, was told by the manager that it would be perfectly practicable to expel men without injury from the torpedo tubes, just as the dogs had been "fired out."

The manager said that after a man had crawled into the tube and the outer door had been opened, letting in the water, only a fraction of a second would elapse before he would be expelled, so that the time during which he would have to hold his breath would be infinitesimal. If the bow of the boat were pointed downward, however, it would be possible to fill the tube with enough compressed air to keep out the water entirely when the outer door was opened. It would be necessary to insert a block of wood in the tube with the man, as was done with the dogs.

The builders think there is little danger of one of their boats ever meeting with an accident that would prevent its return to the surface. In fact, they assert, that such a thing could happen only in the event of the boat running afoul of a cable in a harbor, getting entangled in a wreck or wedged in between rocks. They concede that if such a mishap should happen at least one of the six men who usually compose the crew of a submarine boat must die. One man would have to stay behind to pull the lever that connects with the compressed-air valve.

American and Other Interests in Asia.

LAST month we announced promulgation of the American-Chinese treaty, but gave little space to it, for the reason that at the time it did not seem of as much interest to our readers as subsequent events in the way of hostilities between Japan and Russia have made it of possible concern to them. A writer in *Outlook* gives an interesting account of the treaty's negotiations, from which these abstracts are made: "During the last decade American exports to China have increased sixfold, and with the Chinese province of Manchuria American trade has specially increased. We are, therefore, interested in a change of political control in China more than any other power, because the possible value of our trade is, we believe, greater than that of any other country.

"The American-Chinese treaty which has just gone into effect is the result of nearly a year and a half's negotiation, but it is no mere coincidence that on the day when the Chinese Emperor signed our treaty he also signed a Japanese-Chinese treaty covering much the same ground as ours. The telegraphic exchange of supplementary protocols resulted from a desire on both sides that

the new arrangement should take practical effect; if possible, before the outbreak of hostilities in Asia, if they must come.

"The principal provisions of the treaty relate to trade, and the provision which took effect immediately was that which opens three new localities in Manchuria to foreign trade—Mukden, Antung and Tatungkau. Mukden being provided for in a similar Japanese-Chinese treaty, also proclaimed, Japan and America should occupy the same vantage ground as an outpost for their trade. However pertinent Russia's objection that Mukden, a river port, may not be regarded as belonging to international trade as a coastal port does, Manchuria is still Chinese and not Russian territory. In conceding the American and Japanese requests for trade enlargement, the Chinese Government has done precisely what it did when the Powers, Russia included, requested the opening of the Hankau and other river ports in China to international commerce. Mukden marks, as has nothing else, the fact that American and Japanese commercial interests are one. Hence, in her contention with Russia as to Manchuria, Japan has been really America's protagonist. The presence at an early date of our consular officers, not only on the coast, but in the interior of Manchuria, will, we trust, not only insure the principles of 'the open door' there, but will also diminish Russia's opposition to Japan's demands concerning that region.

"We are glad to note an evidence that this is so. The day after the Chinese Emperor signed the American treaty Count Cassini, Russian Ambassador at Washington, called upon Secretary Hay and repeated to him the assurance of the Russian Government that 'Russian authorities will place no obstacle in the way of the full enjoyment by the Powers having treaties with China of all the rights and privileges guaranteed by such treaties in Manchuria.'"

The war between Japan and Russia is bound to interfere with trade and commerce in the zone affected. It is an unfortunate war, for it is one that could have been avoided, in the opinion of many Americans.

Electricity's Increased Use as a War Agent.

THE American War Department is not behind the Navy Department in taking up and utilizing the newest electric appliances. An interesting instance of the rapid extension of electricity is furnished by the fortifications distributed along our coast. A few years ago the electric light was introduced to add to the comfort of the garrisons and to provide better illumination of the work. Once a generating plant had been installed there was at hand a supply of power in a convenient and easy controllable form, and this led to its use for purposes which were not contemplated at the time the plant was installed.

Electric fans have been put in to make the living quarters more comfortable in hot weather, and electric motors have been adopted for training the guns—a class of work for which they are particularly well adapted. Motors are used to drive the ammunition hoists and do other work which before had either been done by hand or some less satisfactory power. Searchlights have been installed, enabling a fortification to sweep the sea at night.

The various posts of the fortress are connected together by telephone, so that the commandant is in touch at all times with the entire garrison, and can instantly transmit orders to any point. The various fortifications along the coast are tied together by telephone and telegraph, so that on the appearance of the enemy at any point all the fortifications would be informed of it. Submarine mines are controlled electrically, and even the guns may be fired by this means by an officer at some distant point. By means of wireless telegraphy a fortification can be kept in touch with the scouting vessels, and would be informed of the approach of an enemy long before he is visible from the coast.

The telautograph may be brought into service for transmitting orders, and electric signaling lights are replacing the older types. Electric lights lighting the range-finder stations, and electric-clock circuits furnish accurate time to all parts of the fortifications. To insure the continuity of these manifold services, accumulators are now installed, so that there will at all times be a constant and reliable supply of power. Thus, from being at first a small auxiliary, the electrical equipment has extended until it is now probably the most important part of the entire equipment of the fortress.

Corea a Growing Market for Our Products.—American products, both manufactured and otherwise, are popular in Corea, but the very large proportion reaches that country through China and Japan. It is only within a comparatively short time that the direct trade of the United States with Corea was of sufficient importance to justify a separate record. In 1897 the exports from the United States to Corea were \$509 in value; in 1898, \$125,000; in 1902, \$251,000, and for the eleven months ending with November, 1903, \$366,919, indicating that for the entire calendar year 1903 the total exports to Corea from the United States were about \$400,000.

Exports Show Great Gains.—The Government returns for January of this year show that the exports of merchandise from the United States in that period amounted to a valuation of \$141,663,483, being an increase of \$7,671,214 over the same month in 1903. For the seven months ending January 31st the exports showed a gain of \$72,282,848, as compared with the previous corresponding period. All of which is a convincing testimonial of the worth of American goods.

MILLS NOVELTY CO.

INCORPORATED.

CAPITAL, \$500,000.00.

CHICAGO, U. S. A.

The Mills-Chicago.
With Music Box.
Weight, boxed for
shipment abroad,
about 340 lbs.

Rochester, N. Y., U. S. A.

New British Ambassador's Oratorical Debut.

DISTINGUISHED citizens of both countries attended the banquets which were held simultaneously in New York and London recently by the Pilgrims of the United States and the Pilgrims of England, when cable greetings were exchanged and many eminent men made speeches tending to cement the friendship between Great Britain and the United States. A notable feature of the New York banquet was the hearty reception accorded to Sir Henry Mortimer Durand, the new British Ambassador at Washington. Sir Henry's reply to a toast in his honor displayed the thoughtfulness of a diplomat and a broad conception of the friendly relations of the two countries. He said in part:

"Looking about me, surrounded by the faces of white men speaking my own language, and most of them akin to my own people, I feel as if the days of my pilgrimage were over. It really is very hard for an Englishman in America to realize that he is a stranger. He has met with such civility and warm-heartedness that the idea hardly occurs to one. A foreigner he cannot feel, certainly. I have been asked many times since I have been here whether I was beginning to feel at home in America, and I could only answer: 'Beginning to feel at home? Why, how could I feel otherwise?'"

"I am afraid that some Americans think there is too much talk about blood kinship. Perhaps there is. We are fond in England of talking about the Anglo-Saxon race, and we love to think that you and we both form parts of it. But we do not deceive ourselves.

"We know that in a sense a new race is being formed upon this Continent. We know that you are taking to yourselves men of many nationalities and welding them into one great whole. We know that after a lapse of a very few years a man who comes to this country is not a Frenchman, or a German, or an Italian, but an American. And we know that as time goes on a portion of the English blood in the American is likely to be changed.

"But, for all that, there are likely to be close ties between us. Common language is a bond of immense strength. Besides our language, which carries with it a common literature, we have, I think, very much the same way of looking at things, the same ideal. I think that, whatever happens, the spirit of the coming race will be an Anglo-Saxon spirit. [Applause.] It will be of the Anglo-Saxon stamp.

"Meantime, there is one thing of which I think there can be no doubt, and that is that the relations between our country and yours of late changed very much for the better. Certainly in England any feeling of coldness which used to exist has long passed away, and the only feeling toward America is one of warm good-will. [Applause.] Many prominent Americans have told me that if this feeling was not always general it is general now.

"I hold that no nation has ever done greater things than England has done in India, to create an empire of 300,000,000 of men and rule it justly for the benefit of its people. I think that Americans may well be proud of that achievement, too, for the foundations were laid before you.

"Michael Herbert, my predecessor, when speaking here less than a year ago, said that he hoped the reflection of good feeling now rising in Ireland would be felt here in this country, and that the Irish race would bury their enmity now and forever. There is in England nothing but good-will toward the Irish, and I hope that it will always remain so; otherwise, with an Irishman directing our foreign policy, an Irishman at the head of the English army, and another Irishman commanding the Channel fleet we should be in a perilous position."

"To See How the Americans Do It."

THE United States Consul at Frankfort, Germany, Simon W. Hanauer, contributes an interesting chapter to the current history of American progress in the following correspondence: "Not only in political and international law, but in the realms of science, mechanics, economics and business methods, the United States is becoming the high school for the other nations of the world. This is shown by the numerous agricultural and commercial commissions, experts in manufacturing, students of political economy, scientists, ministers of State and chiefs of governmental bureaus, managers of industrial concerns, banks, etc.—all from the highly cultured European countries—visiting the United States for the sole purpose of studying American working methods.

"With far-seeing men in Europe it has become a matter of firm belief that it is strictly essential to study American ways, means and methods before the education of higher craftsmen or managers of industrial or public works, etc., can be called complete.

"The statements which Mr. Goldberger, Dr. Salamansohn and other chiefs of great German financial institutions; Wilhelm von Polenz, the author; Minister of State von Rheinbaden and his accompanying counselors and experts, have made, and which were published by the press and discussed at meetings of economic bodies in Germany, caused deep interest in that country and in all industrial circles of Europe. As a result, numerous visits from other experts, bankers, managers and scientists are to follow, all with the same aim—to study the United States; to see how the Americans do it."

"Three of the most prominent men of German finance and mechanical science are now proceeding to the United States for this purpose. They are Director Dernburg, of the Bank of Commerce and Industries; Director Winterfeld, of the Berlin Commercial Company, and Privy Councilor von Rathenau. The two first named represent great banking and promoting institutions,

and Mr. Rathenau is director-general of the greatest electrical works in Germany."

Readers of the AMERICAN EXPORTER have been kept well-informed regarding these invasions of knowledge-seekers. Almost everything in America is open and above board. Some patentees of inventions have their secrets to preserve, but otherwise the nation is willing to be a high school or an academic institution for those elsewhere in the world who think our methods may be better than theirs. We do not claim that they are, but we are willing to let the acts of our foreign friends justify the increasing value that they seem to place upon our methods and our products. The increase of our exports of manufactured articles is praise enough. If our competitors can benefit by their visits to America we are generous to a point where we will help them all we can, on the broad principle that we are interested in the general welfare of the entire world. It is doubtful if some of our readers fully appreciate the broadness of the average American manufacturer. There are always exceptions to rules, but the rule is that American manufacturers try to the extreme degree to make the best article for the least price that it is possible. In doing this they figure on service and utility.

All machinery is bound to wear out eventually. To a considerable degree it depends upon the treatment it receives, but American manufacturers put their products to severe tests before they place them upon the market and exercise a careful supervision in their manufacture that makes their products thoroughly serviceable, barring extraordinary contingencies which, of course, seldom occur.

British Adopt American Weaving Methods.

UNITED STATES CONSUL FRANK W. MABIN, at Nottingham, England, reports that the visit of British cotton spinners and manufacturers to the United States some months ago is apparently bearing substantial results. He also says: "Changes are being adopted in some of the largest weaving establishments along the line of economical administration, but most significant of all is the tentative introduction of the American automatic loom in several mills. In other establishments recent inventions for the automatic change of the shuttle are being tested, and in some factories the American system of cloth and welt carriers and loom oilers and cleaners is being introduced, so that the weaver's duty is limited to weaving alone. For relieving the weavers of the duties thus automatically performed one firm proposed a reduction of 3½d. (7 cents) per loom per week, which has caused a strike. The workmen claim that the incessant confinement to the loom is more trying than the former conditions, the carrying of completed cloth pieces to the warehouse and the cleaning and oiling of the looms being, in fact, a restful change. No speedy settlement of the controversy is in sight."

American Workmen Seventy Years Ago and Now.

MUCH of America's success is due to the intelligent efforts made by the country's workmen to improve their condition and take advantage of the opportunities offered them for improvement. Recently the trade unions of the big city of Boston invited President Eliot, of Harvard University, to deliver a lecture to them in Faneuil Hall. President Eliot consented, and spoke to an audience of 5,000 union men. It is worth while remembering that seventy years ago the trade unions of Boston gave a dinner and found no place open to them except Faneuil Hall. Twenty-two societies refused to rent their halls to labor organizations. In those days a union man was regarded as half a criminal, and no college president would have anything to do with unionists.

Seventy years ago the union men met in Faneuil Hall as social outlaws. Last month they met in the same place as highly respected citizens of the great municipality of Boston.

Enterprising Concern Enlarges Plant.—The Lunkenheimer Company, Cincinnati, makers of brass and iron steam specialties, owing to the unprecedented and growing demand, both abroad and at home for their specialties, have again greatly increased their facilities so as to be in position to make prompt shipments. They report an increasing export demand for their specialties and inform us that they will shortly place some new specialties upon the market, which will be shown in a complete catalogue to be issued in the course of the next few months.

Hawaiian Commerce.—The external trade of the Hawaiian Islands continues to grow under American control. In 1903 the total was \$40,000,000. The United States figures largely in both exports and imports. Hawaii took \$1,000,000 in steel and iron manufactures from the parent country and was a large consumer of other products.

Three New Booklets.—The Buffalo Forge Company, Buffalo, N. Y., U. S. A., has just issued three new booklets on volume blowers and exhausters, mechanical induced draft and compound engine tests, which will be sent to interested readers of THE AMERICAN EXPORTER who make application.

Growth of the American Nation.—The United States to-day is a nation more numerous by 2,000,000 souls than it was a year ago. Half this growth is natural increase, half comes by immigration. The total increase of a single year is nearly equal to the whole population of Greece or Denmark.

Steam—ENGINES—Gasoline.

We make a specialty of Steam Engines and Gas and Gasoline Engines and Pumps from a 1 H. P. Combined Engine and Boiler for \$100 and a 2½ H. P. Gasoline Engine for \$125 up to any size in either Vertical, Horizontal, Marine, Hoisting, Pumping, Locomotive and Portable Engines on Wheels.

We also make a full line of Saw Mills and Wood-working Machinery, Turbine Water Wheels, Corn and Wheat Mills, Feed Grinding Mills, Sugar and Plantation Machinery, Cars, Locomotives and Track, Etc.

Send for Catalogues A, D, G, O and W. Correspondence solicited.

Also makers of the world-known "Muskegon" and "Michigan" Washing Machines, over 250,000 of which are in use throughout the United States.

NOTE.—When ordering through export houses, to prevent mistakes, please mail us a duplicate of your orders.

America and Germany as World Teachers.

AN interesting and important work on the United States by Wilhelm v. Polenz, entitled "Das Land der Zukunft," has just appeared, and in view of the World's Fair, which the United States is to hold, nothing could have been more timely. He says:

"The most noteworthy surprise of the New World is that every one with the power of discovery that goes thither is able to discover it anew, but no one is competent to write concerning the United States only those whose critical sense has been saturated by the powerful impressions of that wonderland. I have found that we are never so proud as when making a journey, but I have also noticed that our survey of the weakness of German life can never be so well impressed upon us as when we compare ourselves with another strong nation.

"It has become the fashion to wonder at American institutions and to consider them worthy of imitation, but it would be most unwise for us thoughtlessly to incorporate the American nature into our own life. That this young nation across the ocean should give birth to freer customs and more up-to-date accommodations than Europe in its narrowed sphere is natural, but it is as impossible to Americanize Europe as it would be to bring the United States to look at things from the standpoint of Europe. It is one thing to become absorbed into a strange people without resistance, as the German often does, to his harm, and another to endeavor to be just in regard to them. Boundless wonder should not seize us in regarding the United States, and in opposition to the 'unbounded possibilities' should be placed the saying of the Germans, 'Care will be taken that the trees do not grow to the heavens.'

"No extra European nation has made such progress in all lines as has the United States. With no country have we had such traffic as with the United States. There are no two other nations which could learn more from each other, nor do any two nations so thoroughly fail to understand each other. Gigantic is the only word with which to measure the traffic between the shores of the two countries. The two peoples may touch each other outwardly in a hundred ways, but their souls do not meet. The rôles have been changed. Whereas, formerly, at least for a very long period of time, European influence was the dominant one in civilization, Europeanizing all people that it touched, to-day it is the United States that is Americanizing everything, even Europe. With no nation on earth has the empire had closer relations than with the United States, particularly since 1870."

Novel Experiment in Technical Education.

AMERICAN educators are always alert in adding new features to their methods, but the latest is a decided novelty. An experiment in mining education is to be tried this summer under the joint direction of four universities. It is proposed that the senior mining students of these institutions, and possibly a fifth, shall hold a joint summer session for the study of practical mining and mine engineering this summer in one of the mining districts of the State of Colorado.

The students will go into camp at a mine to be leased for the purpose, a small force of skilled miners will be employed as instructors, and the students will engage in actual mining operations, sinking shafts, driving levels, stoping ore, timbering and similar practical work, and will make underground surveys, take samples from the ore bodies, make assay plans and undertake other work of an engineering character. The conduct of the Summer School is to be in the hands of an Executive Committee consisting of college professors.

Summer schools of this character have for the past twenty or twenty-five years formed an important part of the regular work at the leading mining schools in the country. These summer sessions have been held in turn in various mining districts and at various mines, where the students have been received by the courtesy of the mine management. It is felt, however, by the professors in charge of these summer schools that this has become a serious tax on the kindness and good-will of the mining companies, and at the same time it has not been possible, without seriously interfering with the routine work of the mines, to carry out certain details of instruction as fully and completely as might be wished.

The proposed plan of leasing and operating a mine for the instruction of students will increase largely the cost of the summer schools. It is believed, however, that the gain in efficiency will fully warrant the increased expense. George Crocker, through John Hays Hammond, has offered to pay the cost of the school this summer, and has placed \$12,000 for this purpose in the hands of Mr. Hammond and the presidents of the four institutions named, who will act as trustees of the fund.

Workmen All Blind in This Factory.

THERE is a curious carpet, broom and chair-bottom factory in Philadelphia, U. S. A., which, if you entered it at 5.30 on a winter evening, you would find running full blast in total darkness. You would hear men running about, shouting orders, carrying goods or singing and laughing to the rattle and whirr of fast looms and other machinery, yet you might not be able to see your hand held a foot from your face. The explanation is this: No light is needed, for only blind men are employed. The owner is blind, the superintendent is blind, and so are the bookkeeper, machinists, clerks and the 125 workmen. Six of these have neither sight, hearing nor speech. Only two or three men with sight are employed to look after the choosing of colors and do other occasional overseeing work in the broom department.

Here is a remarkable condition of affairs, yet this factory does a business of over \$100,000 a year.

The enterprise was founded by H. L. Hall, himself blind, and who still conducts it. Finding that, owing to the lack of organization, it was impossible for blind men to make a living at the trades they were taught in the institutions, the raw materials alone costing them more than they could get for their brooms and chair bottoms or carpets, he set about to organize the trade himself. Now he is crowded for room, and has a waiting list of 100, all of whom are blind. Mr. Hall sits all day at his desk, a telephone beside him, a clerk at his elbow. Every detail of the work he has at his fingers' ends, every employee is known to him personally.

American Methods and Machinery.

ACCORDING to United States Consul Harris, at Manheim, Germany, a query frequently raised by the German press is how American manufacturers paying wages at least twice as high as are paid in Germany are able, in many cases, to produce their wares cheaper than they can be produced in that country. Consul Harris offers these observations in discussing the matter:

"The solution of this question is certainly before the German manufacturer as never before. He sees that the cheaper raw material and boundless natural resources of the United States furnish only a partial answer, and that the real solution is to be found in a manufacturing system that rejects traditional methods—a system the keynote of which is to lessen the cost of production; that consigns a machine to the scrap pile as soon as a better one is to be had, and in turn consigns that one to the scrap pile when occasion demands—a system that offers a constant incentive to each man connected with the manufacturing plant to bring out the best that is in him.

"The advantages of such a system have been again and again referred to by the German press during the past year. It will undoubtedly be the standard toward which, in the future, the German manufacturer in all lines will strive. He has already accomplished much in this direction. How rapidly and to what extent he may further advance remains to be seen. Whatever change or scope or method may occur in the future of German manufacturing, without question the United States will be the model whose methods will be chiefly studied and whose machinery will continue most in demand.

"American manufacturers should be able to show that their machinery offered for sale embodies the latest improvements. If the fact can be demonstrated by actual experience that certain classes of machinery cheapen the cost of production 15, 25 or 50 per cent. over other machinery now in use, that fact will more than ever before commend such machinery in this market. The exact conditions as to skill of workmen, hours of labor, etc., under which such reductions of cost are made should be clearly stated, but not overstated.

"Farm machinery is rapidly taking the place of hand implements. In a small area of southwestern Germany the number of American farm implements sold each year runs well up into the thousands, showing how the scythe and the sickle are giving way to the mower and the harvester. Modern creamery appliances have gone into every cattle-raising locality. Woodworking and ironworking machinery are forcing handwork to the rear. Hotel elevators—scarcely to be found at all a few years ago—are now used in all the better German hotels. It is but a few years since large apartment houses, with handsome stone fronts, had neither steam heat nor modern sanitary plumbing. Now all such houses are supplied with both."

Consul Harris adds: "These changes suggest that Germany will continue to be an appreciative market for labor-saving machinery and for office, store and household furniture of such types as are likely to find favor in the United States. They suggest also that the German manufacturer will have a home market similar to our own to stimulate him to greater excellence and make him a still more formidable rival in the open markets of the world."

Germany's Friendship for the United States.

FOR reasons not easy to understand, a section of the American press has shown an increasing disposition in recent years to seize upon and magnify everything that might be construed as an act of unfriendliness toward this country on the part of Germany, whereas the events and happenings that have a marked tendency in the opposite direction are studiously ignored. The German Emperor has never, in fact, failed to make the most of every opportunity to manifest a cordial feeling toward the American people, and there is no good reason to suppose he has ever entertained any other—*Leslie's Weekly*.

"The American Girl."—The Geo. L. Squier Manufacturing Company, of Buffalo, U. S. A., have just received from one of the most artistic lithographing houses in the country an elegant reproduction entitled "The American Girl," size 15x20 inches, and the work is executed in fourteen colors. Art connoisseurs have pronounced it one of the handsomest subjects ever produced. A copy will be mailed free, substantially packed in a large, heavy mailing tube, to all plantation owners who may make application for same.

Agricultural Growth of the United States.—The total value of farm property in the United States in 1900 was more than five times as great as in 1850 and 28.4 per cent. greater than in 1890. It was largely due to the excellence of the agricultural implements manufactured in America.

De Laval Cream Separators.

Immediate and absolutely complete separation of cream from milk by machinery.

500,000 Machines in Use throughout the Dairy World.

A saving of 10 to 25 per cent in any climate, and 25 to 100 per cent. in warm countries.

The Recognized Type of MOTOR for **Automobiles**

IS THE

Brennan Standard Gasoline Motor

(Non-Vibrating),

With Transmission Gear on Motor Shaft.

From 5 to 30 H. P.

Accepted as "The Standard" throughout the United States and now being adopted in all parts of the civilized world. Our illustrated catalogue and full particulars mailed postpaid. Orders received direct or through export commission houses.

BRENNAN MOTOR CO., Syracuse, N.Y., U.S.A.

The Handy Fruit and Vegetable Slicer

The most interesting kitchen utensil ever invented. It slices every kind of fruit or vegetable into an infinite variety of unique and fancy designs, making an entirely new, novel and delicious product.

Is invaluable for making delicate salads, garnishings, etc. Makes Juliennes ten times as fast as by the ordinary method and is the only utensil that will produce Lattice Potatoes. Is extremely simple to operate and sells rapidly wherever shown.

\$16⁵⁰ Upon receipt of SIXTEEN and 50-100 DOLLARS **100** in U. S. Gold or its equivalent, we will deliver boxed, ready for steamer, F. O. B. cars New York, one gross [144] **No. 6 X SLICERS, for Export only.** Weight boxed, 120 lbs.

NOTE.—To facilitate our rapidly increasing export trade we desire to arrange with one responsible business house in each trade center of the world, to handle our NO. 6 X SLICERS and other specialties manufactured by us.

JULIENNES

LATTICE POTATOES

Some Features of the Shoe Industry.

THE boot and shoe industry in America has been making strides, and the manufacturers engaged in it are of the right sort of American merchants. It is not our custom to admit to these columns anything derogatory of the methods of other countries, but the following from the *Shoe and Leather Gazette* contains in that respect only what other trade journals throughout the world have printed, and does add some information showing what our American shoemakers are doing:

"This country may not claim to be fully up to the Utopian standard, but occasionally a comparison is offered which should make us pretty well satisfied of the fact that it might be worse as a place for human beings to live and work. The celebrated 'solid shoe' case recently tried in England offers in its details a striking picture of conditions in that country which could hardly be paralleled here. The shoes in controversy were ladies' shoes, made to sell at retail at about 80 cents a pair. They were not made of frankly coarse and cheap heavy leather, but of a 'shabby genteel' sort, with pasteboard insoles that one step in a wet place would ruin. It is stated that such shoes are made and sold by thousands in England to a class of people who never seem to be able to get money enough together to buy better ones.

"Contrast such a state of affairs with the conditions prevailing in American towns, where the average price per pair for shoes has been climbing for several years. Our traveling staff correspondent mentions one firm that runs a \$3.50 store, whose greatest difficulty is in persuading people to be content to pay that small amount for a pair of shoes. In the same city are stores that have a line of trade that buys \$8 and \$10 shoes, the firm selling more of these grades than of all others. No, this country may have imperfections, and it may be run in a haphazard sort of way, but for people whose working ability is their only excuse for living it is about as comfortable a place as there is visible."

Our contemporary treats the matter in a way that is more interesting from a domestic standpoint than otherwise, but the fact will be appreciated by purchasers of shoes in other countries. American shoe manufacturers now produce goods that cannot be excelled anywhere in the world for the price charged, and we look to see our export trade in this commodity increase greatly in the future.

American Shoe Machinery in France.

UNITED STATES COMMERCIAL AGENT GRIFFIN, at Limoges, France, sends the following interesting news to the State Department, Washington: "The United States still leads in the manufacture of shoes and shoe machinery. The best leather, machinery, threads and all other furnishings for shoemaking are imported from the United States. It is surprising to notice the gradual change that is taking place in shoe shapes. The striking peculiarities that characterized French shoes ten years ago are rapidly disappearing and American shapes are now found everywhere. The model lasts are imported in large quantities from Massachusetts, U. S. A., and are extensively copied throughout France.

"The largest shoe factory in France uses only American machinery. The growth of this manufactory is phenomenal. Before the Paris Exposition of 1900 this factory was a very small one, employing only French machinery. Since then it has increased until it is now the largest in the Republic. The American shoe machinery exhibited at the 1900 exposition at Paris was bought in block by this firm, and to-day its annual sales run up into the millions of francs. Two enormous new buildings have been erected within two years and more than 1,000 hands are constantly employed. There are six large factories making shoes in Limoges that now use American machinery, and many other like factories are being started in other parts of France to be furnished with American machinery also."

New Apparatus for Fighting Fires.

THE chief of the Schenectady (U. S. A.) Fire Department is the inventor of a new piece of fire-fighting apparatus, which will soon be put to the test in that city. A local paper describes it as a fire boat on wheels. It consists of a big monitor, such as is used on board the fire boats of the large American cities, but in this case it is mounted on two wheels, so that it can be pushed wherever it may be desired by a couple of men. The nozzle has the additional feature that a curtain or shield of water is projected therefrom in all directions, making a perfect envelope around the firemen who may occasionally be compelled to go to the machine and direct its operations. As a rule, however, after it has been placed properly it needs attention only once in a while, when the direction of the stream has to be changed.

American Rails for Turkey.—An American steel company has been awarded the contract for 20,000 tons of steel rails, fish plates and bolts for the Hedjaz Railway. These rails will lay about 600 miles of the new railway from Haifa to Mecca in the Turkish Empire.

American Typewriters in Demand.—The export trade in typewriters in 1903 amounted to \$4,537,396, an increase of nearly \$1,000,000 over the previous year, which indicates that our products in this line are becoming more and more appreciated abroad.

Illuminating the Passage of Projectiles.

PERSONS on vessels passing Sandy Hook, which is the sentinel of New York harbor, have been puzzled at night by what looked like balls of fire darting out from the shore. The brilliant projectiles, chasing each other over the water at a terrific rate, resembled monster rockets. The explanation of the phenomenon is found in the fact that the United States army officers at the Sandy Hook proving grounds were experimenting with a device invented to enable gunners to watch the flight of a projectile from a gun at night.

Some months ago there were tests of this chaser at Sandy Hook, but since then the inventor has materially improved his device. It consists of a chemical combination, much like that which forms the basis of night fireworks, and is enclosed in a brass box that is screwed into the rear end of the projectile. When the gun is fired the forming gases ignite this material which burns brightly, leaving a brilliant line of fire as the projectile flies through the air.

The idea is that the artillerymen will be able to see what they are firing at, or, at least, what the projectile hits. The United States Navy has experimented with similar schemes. The chaser, as it is called, is understood to be intended principally for rapid-fire guns, whose function it is to guard against attacks of torpedo boats. The attachment does not interfere in any way with the firing of a gun.

America Feeds Far East Combatants.

THE provision trade journals report heavy demands upon the great meat dressing and provision packing firms of the United States for supplies to sustain the warring armies in the Far East. They say that previous to the actual outbreak of hostilities negotiations for the purchase of American provisions were on an enormous scale, and that it is estimated that shipments of mess and corned beef from American centers on concluded contracts for Russian account approximated, down to the middle of February, 7,000,000 pounds.

The same journals also say that the impression, widely entertained, that the Japanese soldiers subsist on a cereal diet, must be erroneous, because of the ordering by Japan of 7,000,000 pounds of meats from the packing houses of this country.

The further "rush" demand from Russian agents for 5,000,000 pounds of dressed American meats for immediate delivery at the port of San Francisco, on the American Pacific Coast, indicates that, should the present war prove prolonged, this country will have a market for all the meat it can spare during the war's continuance.

New Style of Umbrella Protects Body and Legs.

A NOVELTY in umbrellas, which the *American Inventor* has named "the awning umbrella," has recently come out in the United States. It is intended not only to protect the upper part of the body, but, in addition to performing the usual service of an umbrella, is designed to shield the trunk and legs as well. A curtain is suspended from the ribs of the umbrella, and it may be detached therefrom at will. Two slits in the awning are connected by an apron, thus affording shelter for the back. There is an aperture through which the wearer may pick his steps. The umbrella can be closed without removing the under structure, which may be fastened on the tops of the ribs.

Big Engineering Feat of Two Young Americans.—Two young Americans, 23 years of age, and house-movers by trade, have just accomplished an extraordinary feat of engineering. They have successfully moved a 300,000-pound steel oil tank down a steep hill to the Allegheny River, transported it a mile down the river on barges and placed it on a bank 200 feet high. The monster tank was sunk seven feet in the ground, and had to be raised before it could be moved forward an inch. The five tracks of a railroad had to be crossed, and the railroad company gave the movers only forty minutes' time to get from one side to the other. This is said by an authority on the subject to have been one of the greatest tasks ever accomplished by any house-mover. The work was done by twenty-four men and two horses in six weeks.

New Automobile Fuel.—The Brooklyn *Eagle* announces that a new odorless automobile fuel, which is said to be of 80 per cent. greater energy than gasoline, will be placed on the American market in a short time under the name of energine. They hope to bring about the solution of the problem of obtaining a high-power fuel without any objectionable odor. The new company is about to erect a factory in Cleveland, in which it will refine from the crude petroleum a product to be known as energine. This has already been tested by a number of automobile manufacturers, and, it is said, was found to bear out to the fullest extent the claim of the originators as an odorless fuel. It is claimed that one gallon of this new fuel will carry a heavy touring car eighteen miles, while the same quantity of gasoline will carry the same car only ten miles.

Demand for American Peg-making Machinery.—United States Consul F. D. Chester, of Budapest, Hungary, reports that the Commercial Museum in that city desires a list of American manufacturers and exporters of wooden peg-making machines. The demand for these machines for export is increasing.

ANIMAL TRAP CO., ABINGDON, ILLS., U. S. A.

Largest Frog-Leg Market in the World.

IN two adjoining American cities is located the largest frog-leg market in the world. Frogs are found in other States than Minnesota, but nowhere else in the United States has the industry achieved such proportions as in the region surrounding the twin cities of St. Paul and Minneapolis, in the State just mentioned. The total receipts last year from the frog catchers of the State exceeded 500,000 dozen, requiring the slaughter of no less than 5,000,000 frogs. Five years ago no frogs were shipped out of Minnesota. Now the business amounts to upward of \$100,000 a year. Minnesota caught frogs are in great demand in New York and other prominent cities, and the demand is constantly increasing. It is expected that the industry will spread to the export trade and American frog legs are likely soon to be shipped to France and other countries where the delicacy is appreciated.

The frog catchers are located near the smaller lakes throughout the State. They know all the characteristics of the frog, where to find him, how to catch him and where he nests. The heaviest catches are in the fall and spring. The frogs breed very fast, and as it only requires a couple of months for them to attain their full size it is almost impossible to exhaust the supply. Unlike oysters, there is a good demand for frog legs all the year round, and it is necessary to hunt them in the winter time when the ground is frozen to the depth of 2 or 3 feet and the ice covers the ponds to the thickness of 24 to 36 inches. But with all these drawbacks it is not difficult for those engaged in it to gather in \$10 a day at this occupation. When the frogs take to the water in the fall the professional frog catcher watches them and learns where they nest. He waits until the prices are higher in the winter and cuts the ice over this nest, scooping out great nests of frogs. As many as 500 to 1,000 can be secured in one of these nests in good seasons. This keeps up the supply the year round and makes the market a steady one, comparatively.

The frog legs are all shipped by express, packed in ice. In the cold-storage houses in the chief cities there are frog legs held as a reserve emergency, the dealers often being called upon to supply an unusually large amount for banquets or other entertainments.

Great Claims Made for a New Motor.

PARTICULARS published in the New York *Herald* of a new motor that will increase the speed of ocean steamships have been read with much interest in America, where the general impression is that such speed cannot be greatly increased without a sacrifice of safety. The motor was invented by Peter Thornley, a Burton-on-Trent engineer, and the *Herald* says of it: "The invention is considered of such importance that its development may result in express railway engines running at twice their present speed at only half the cost and in Atlantic liners crossing from Liverpool to New York in three days.

"The invention is almost small enough to be carried in a typewriter case and so compact that everything is inclosed except the driving wheels. The new motor is capable of developing 1,500 revolutions a minute, giving 15 horse-power under a boiler pressure of 200 pounds to the square inch. In even the best railway locomotive the steam is admitted after the piston has moved from 5 to 8 inches along the cylinder, thus forming a vacuum of several hundred cubic inches in extent to be filled before an ounce of power is exerted.

"Mr. Thornley has devised a valve which will admit a given quantity of steam at every commencement of the stroke and so nicely adjusted that the expansive force of the steam admitted is just sufficient to drive the piston at the end of its journey. By the most modest estimate the saving in coal is 25 per cent., while the simplicity of the motor is such that the initial cost is much cheaper than existing types. It is actually claimed that one ton of coal will produce as much power as eight tons with existing types. It can be worked just as well with compressed air as with steam."

Waterproof Fabrics in Considerable Demand.

MANUFACTURERS of waterproof fabrics in America have found a greatly increased demand at home and abroad for their cloths.

Americans who used to be content to carry umbrellas to keep the rain off of part of their attire in inclement weather now insist on having further protection, and no thoroughly clothed American now depends upon umbrellas alone for protection. There are various kinds of waterproof cloth, aside from the rubber that is used in rubber coats.

Rubber coats are still recognized as absolutely rainproof, but the trade finds the demand to be for something not so warm and uncomfortable, but equally impervious to rain. Some manufacturers take a cotton fabric, stamp it on one side with a fast print and coat the other side with a thin preparation of rubber. This cloth is being used considerably for women in cloakings. Wool fabrics, of course, are the goods usually selected for the waterproofing process. The shrinkage of wool makes it to some extent waterproof, as shown in the Irish friezes, which, when of good quality, will shed water for a considerable time.

The vogue of the waterproof class of goods has led to some novelties, such as the manufacture of mercerized cotton fabrics in color designs similar to those of cravenette and other waterproof cloths. One mill has turned out a line of mercerized fabrics that is adapted for waterproofing, and the results are declared to be highly satisfactory. The goods may be used without water-

proofing and closely resemble cravenette in appearance. There are black and white, tan and white, green and white and blue and white mixtures in this line. There are also overchecks, and it is expected that there will be quite a run on these goods for women's cloaks and suitings. In men's wear about the only use for the waterproof cloths is in overcoats, but women find the materials serviceable for coats, cloaks, suitings and skirts.

Wealth and Commerce of the World.

SOME very interesting information is contained in a statement issued last month by the United States Department of Commerce and Labor through its Bureau of Statistics covering the area, population, commerce, revenue, expenditures, indebtedness, currency and stocks of money of the principal countries of the world. From it we learn that the total exports of the countries and colonies of the civilized world are \$10,278,616,000 and the total imports \$11,525,755,000, making the aggregate commerce \$21,804,391,000. The aggregate of the world's commerce at the present time may therefore be set down, in round figures as \$22,000,000,000. While, presumably, all exports become, in turn, imports, the stated value of these imports exceeds by more than \$1,000,000,000 the stated value of the merchandise in question when stated as exports. This increased value is accounted for in part by the value added through transportation, insurance, etc.

The population of the countries and colonies included in this statement is given at 1,487,159,000 and their area at 40,701,936 square miles. This figure of population in the countries included in the table seems to justify an estimate of 1,600,000,000 as the approximate total of the world's population at the present time. The total revenue for the latest available date of the countries and colonies included in the list is set down at \$7,854,301,000 and the total expenditures at \$7,939,540,000.

The total indebtedness of the countries named in the list is given at \$34,389,604,970; but as the statement does not include the indebtedness of certain minor colonies and divisions, the total national indebtedness of the world at the present time may safely be put, in round terms, at \$35,000,000,000. The interest charge on the public debt of the countries named is given at \$1,416,397,448.

The stocks of money in the countries named are stated at \$11,999,300,000, or, in round numbers, \$12,000,000,000, but in this statement the value of the monetary stock of silver standard countries has not been changed to conform to the decline in silver values.

Invention That Spreads Daylight.

AS American cities become more densely populated and the land increases in value, the buildings of necessity are built higher and higher. New York, as a writer in *The World's Work* puts it, has passed through the five, ten, fifteen and twenty story stages, and has now reached the point where the cliff dwellings and places of business tower thirty stories above the chasm-like streets. The thoroughfares of modern cities in the congested business districts are so hemmed in by the mountainous buildings that the direct sun shines on them only at midday.

There is a constant struggle for daylight among builders; light-wells faced with white enameled bricks have sunk through story after story at great cost of space and money, and windows drink in the unsullied light of the sun greedily. Daylight is an asset, and buildings or rooms commanding it may be rented at an increased price.

The workers in many an office in every great city are compelled to work under an artificial light all day long, and the number of rooms where people have to light the gas to dress even in summer, and where the blessed sunlight comes in meager gray streaks, are beyond counting.

As long as men crowd together in order to do business conveniently and build their dwellings so as to be near their offices, just so long will the congestion continue, tall buildings be erected and the struggle for daylight go on. To meet this condition an American has invented a system of prisms, which reflect the light in such a way as to greatly increase the amount of daylight suffused through buildings. These prisms act like a myriad of mirrors that catch the perpendicular rays and turn them horizontally into the room.

American Style of Ventilation of Theaters.

THE ventilation and heating of theaters is a problem not easily mastered by ordinary heating engineers. In a crowded auditorium of this kind ventilation is the all-important question. It may be a simple matter to heat the building to a required temperature, but to maintain a constant temperature and a pure atmosphere is not so easily accomplished. Fresh air to breathe must be supplied constantly to the occupants and the impure air must be removed. Evidently a system giving a forced circulation of air is necessary to meet these requirements. A good example of this system is the recent installation in the New Franklin Square Theater, at Worcester, Mass., U. S. A. The heating and ventilating apparatus consists of an electrically driven fan and heating coils located in the basement. By means of an exhaust fan and blowers fresh air is drawn from the outside and forced through coils of steam heated pipes and then through ducts to the desired parts of the theater. The foul air is carried out through the dome and roof of the theater by means of an electric exhaust fan.

SMOOTH-ON.**Smooth-On Castings**

An Iron Cement for smoothing over rough and defective places in iron castings, applied by mixing with water, becomes as hard as iron and the same color.

SMOOTH-ON IRON CEMENT No. 1.

UNEQUALLED FOR BOILER PATCHING, MAKING FLANGED JOINTS.

Extract from a Report from an Engineer in Charge in the Department of Construction and Repairs, United States Navy, New York Yard:

SMOOTH-ON JOINT

"I have three 14-foot Scotch boilers, and the joints under the main stop valves leaked and were re-made by me with every kind of packing I had on hand, including red lead putty and wire gauze. They were re-made every time we had a chance, and, getting desperate, I tried Smooth-On three years ago, and they have never leaked since."

Write for our 60-page illustrated book telling about the different SMOOTH-ON cements and their uses. Sent free. When ordering, state for what use. Cements packed in 5, 10 and 25 pound tins.

THE INGERSOLL AMERICAN WATCHES

THE Ingersoll watches as shown here
have revolutionized the watch
trade of the world. They have
established new standards of
value. Buyers of watches, in
justice to their own interests,
must consider this line. For-
eign buyers have long been ac-
customed to purchasing cheap
watches, both cheap in name
and quality, but we now offer an oppor-
tunity to purchase watches guaranteed
to keep good time at very low prices.

Our watch factory is the largest in the
world devoted solely to manufacture of time-
pieces. The output is five thousand watches
per day, which go to all parts of the
world.

PRICES

Yankee, \$7.80 doz.
Eclipse, \$10.20 doz.
Triumph, \$13.20 doz.

F. O. B. New York.

Catalogues and full information, also
special discount for quantities, may be
obtained through your commission
house or direct from us.

One gross of watches packed for export
weighs about 50 lbs. and measures 1½ cu. ft.

Send all orders through your

OCEAN WAVE WASHERS

Wash the clothes as easily and cleanly as sea waves wash the beach.

OVER 100,000 NOW IN USE.

Shipping weight, 85 lbs.

Size, 2 x 2 x 3—12 cubic feet.

SPECIAL FEATURES.

Our Gearing: Simple in construction; impossible to throw out of gear; the longer it is used the easier it will run. Our Fly Wheel has no threads to strip; no nuts to lose, being attached or detached in a moment's time. Our Improved Dasher is hand-turned; clothes do not cling to it and tear. We assure free action of dasher by using heavy galvanized flanged ring in dasher block, thereby relieving all friction. In general construction of tub and finish, only best materials are used. We ship through any responsible New York exporter. All orders must be sent to us direct.

Used universally in factories, warehouses, public buildings, etc. Orders filled through commission houses. Correspondence solicited. Catalogue D on application.

Develop Your Mineral Resources

THE PORTABLE STAR DRILLING MACHINE

is especially designed for drilling oil or gas wells, water wells and mineral prospecting. Every machine is complete, and is so built as not to break or get out of order, being made to operate ENTIRELY WITHOUT SPRINGS.

F. S. Gilbert, Cleveland, Ohio, writes: "I have frequently drilled 100 feet in 24 hours with my Star. It will doubtless make possible, in time, the cultivation of the arid western desert."

John Calkins, Newton Falls, Ohio, writes: "Have two of your Star Drilling Machines, and they take the lead of all others. I have drilled 76 ft. in 10 hours, 64 ft. of it in rock."

**Star Drilling Machines are made in Ten Sizes.
Will Drill 250 to 2500 Feet.**

They are the very best machines on the market. We also manufacture Drilling and Fishing Tools.

Send for our illustrated catalogue.

**THE GENUINE****"O.-K." WASHER.**

KNOWN AND IN USE THROUGHOUT THE CIVILIZED WORLD.

The O. K. is the KING of ROTARY WASHING MACHINES! Because:

1. The O. K. is the only Rotary Washer that has Revolving Steel Ball Gearing, reducing the friction and thus making the machine so light running and almost noiseless.
 2. The tub is made of Louisiana Red Cypress lumber, and corrugated similar to a washboard. The legs are made removable, and are packed inside of the tub, as are all of the castings.
 3. The wheel turns right or left, pin-wheel or dasher reverses automatically, turning the clothes back and forth through the hot soap-suds, and cleaning them without rubbing them to pieces.
 4. The O. K. Washer is made by experienced mechanics, and will outlast any other washer on the market.
 5. The tub has a wringer box, fastened with steel brackets.
 6. The lid on tub closes tight, no escape of steam.
 7. Has glided hoops, castings and name.
- Prices quoted F. O. B. New York. Each O. K. Washing Machine, crated, ready for transportation abroad, weighs about ninety (90) pounds, and occupies nine (9) cubic feet.

New Jersey Seam Paint,

A Perfect Substitute for Pitch.

NEW JERSEY PAINT WORKS,HARRY LOUDERBOUGH, Proprietor,
JERSEY CITY, N. J. U. S. A.**Remarkable Fact.**

This cut is a copy of a photograph of a board having one end painted with New Jersey Copper Paint, manufactured by Harry Louderbough, proprietor of New Jersey Paint Works, Jersey City, N. J., U. S. A., and placed in the water at Port Royal, S. C., for five months. Upon the unpainted end you can note the ravages of the salt-water worm so destructive to wood, and also the large number of barnacles that have fastened upon it. Observe the painted end, where New Jersey Copper Paint was applied—its splendid condition.

The board here represented was placed in the water at Port Royal, S. C., by me, and left in the water five months. The painted end was as good as when it was placed in the water.

Price, including battery, f. o. b. New York, weight 4 lbs., - \$50
Battery, extra, weight 12 lbs., - 6

Thousands of Protectographs

Are now in daily use by the leading financial, industrial and mercantile institutions of America, and are exclusively employed by the United States Government.

The machine is a marvel of simplicity, being but six inches square and weighing only ten pounds, boxed ready for shipment. One movement of the lever indents the limiting line upon any preferred part of the check (see reduced facsimile of check) and by its system of compound levers forces an especially prepared indelible ink into the fiber of the paper, making it a part of the document itself and rendering its removal impossible.

The Protectograph is made to conform to the monetary standard of all countries and to print in any language. The price is \$30, delivered New York City.

TARR & WONSON'S COPPER PAINT

For Wooden Vessels' Bottoms, prevents boring of worms and all marine growth.

Awarded Eight Highest Medals: Gold, Silver and Bronze.

Excels on Every Point. Cheapest to Use in the End.

TESTIMONIAL. NEW YORK, Aug. 3, 1903.

Messrs. Tarr & Wonson, Ltd., Gloucester, Mass. Gentlemen: It affords me great pleasure to comment to the credit of your copper paint.

I used your paint on my vessel here December 10, 1902; bottom in poor condition for good coat-damp; remained at the dock here forty-nine days; thence to New London, Conn.; thence to Cay Frances, Cuba, where we remained at anchor in only 18 feet water—water very warm—for eighty-seven days; thence back to New York, when I hauled on dock for painting again, July 5, 1903. I found the surface clean and clear of sea growth of every nature, hence my relative feelings toward your product is, beyond doubt, to the head of the list to stand the severe test as it did of the shoal, warm, clear Cuban water, and I claim its outfit is complete. Yours very truly, (Signed) A. A. LOWELL, Master Sch. Edward H. Blake.

THE WORLD'S STANDARD FOR FORTY-ONE YEARS. RACING COMPOUND for Wooden Yachts' Bottoms, Bright and Smooth.

Manufactured Only by TARR & WONSON, Limited, GLOUCESTER, MASS., U. S. A.

WOODWARE SUPERSEDED BY THE INTRODUCTION OF THE International

(Galvanized Steel)

Washing Machine.

Will wash fabrics, coarse or fine, as quickly and cleanly as any washing machine made, and being made of **Galvanized Steel** will outlive and outwear ANY THREE Wooden Washing Machines.

The galvanizing is performed after the machine is put together, thus preventing cracks, which would cause rust.

Being **absolutely germ-proof**, is the only perfect, sanitary washing machine in existence.

\$11.00 Upon receipt of Eleven Dollars, U. S. Gold (or its equivalent), we will crate, ready for steamer, and deliver f.o.b. cars at New York City,

TWO (2) INTERNATIONAL (Galvanized Steel) WASHING MACHINES.

Each machine occupies six cubic feet. Weighs seventy-two pounds.

INTERNATIONAL MFG. CO.,
RACINE, WISCONSIN, U. S. A.

The Tucker Alarm Cash Till.

A perfect day safe. The act of closing locks the till. Over one million now in constant use. No key to be lost. Susceptible of 32 changes. Opens like a common drawer. A terror to sneak thieves. Handsomely finished in walnut, oak or cherry woods. Varnished and polished.

As a piece of cabinet work, well worth its cost.

Sounds the alarm promptly if tampered with. Delivered ($\frac{1}{2}$ doz. in a case) free to vessel. Catalogues in English and Spanish.

Cold Chisels.

We have been making Tools for over 32 years and are selling our Cold Chisels to many of the largest American jobbers.

To introduce our product to the Foreign Trade we will on receipt of \$50.00 U. S. gold, or its equivalent, pack for export and deliver in New York the following Assortment of our Cold Chisels:

15 dozen Chisels made of	3/8 inch Octagon Steel,
15 " " " " " "	1/2 " " " " " "
15 " " " " " "	5/8 " " " " " "
15 " " " " " "	3/4 " " " " " "
5 " " " " " "	7/8 " " " " " "

This assortment will weigh approximately 550 lbs. The two smallest sizes are packed 1 dozen in a box. Each box carefully labeled. This is an offer that should not be overlooked. It may not appear again, so better order now. If you send your order through an export house, better send a copy direct to us to avoid all chance of error.

W. H. ANDERSON & SONS,

Tool Manufacturers and Steel Workers,

Detroit, Mich., U. S. A.

OUT-HATCHES ITS COMPETITORS!

Why does the Reliable Incubator give such remarkable results—hatching 85, 90, 95 per cent. of the fertile eggs? Because our heating, regulating and ventilating systems give pure, vitalizing oxygen to germ and growing chicks. Other reasons why the Reliable is a profit-bringer are its durability, and economy of time and material. It has double top and bottom, made of best kiln-dried lumber, so treated as not to absorb moisture.

Reliable Incubators

have trays so constructed that it's easy to reach either eggs or chicks. Remember, too, that the Reliable out-hatches its competitors so often because the heat in corner or center is always the same temperature—a mellow, even heat in every cubic inch of the egg chamber. Our new catalogue is free. It tells a lively story giving warnings, and simple, yet full instructions on hatching and raising poultry successfully. Just send 10 cents to pay postage

is always the same temperature—a mellow, even heat in every cubic inch of the egg chamber. Our new catalogue is free. It tells a lively story giving warnings, and simple, yet full instructions on hatching and raising poultry successfully. Just send 10 cents to pay postage

RELIABLE INCUBATOR & BROODER CO., Box A 000, Quincy, Ills., U. S. A.

"SUVLIGHT," THE LIGHT OF THE AGE.
Patent No. 738160—150 candlepower—saves 80 per cent. of gas and gives a beautiful electric effect.

Never Blackens Mantles.

Incandescent Burners, as generally constructed, give much annoyance and trouble always to get the exact mixture of gas and air to make the most effective combustion, but with "Suvlight," by the simple movement of the thumb, the exact proportion of gas and air and the highest possible illumination are instantly obtained. Adapted for all kinds of lamps, mantles and any variation of gas pressure. It is the long-felt want in private and business houses. Write for lowest export prices.

"SUVLIGHT" GAS HEATERS

Introduced Into the Whole World. Good for All Seasons, "Suvlio" has stood the test of time. Name "Suvlio" and Patent Nos. 571916, 27876, 573205 stamped on top of each heater. If you handle similar heaters be sure they are not infringements, and thus render yourself liable for damages. "Suvlio" is the real thing—better and cheaper.

SUVLIO HEATING AND LIGHTING CO.,

1079 Third Ave., 40 West Broadway and 59-61 Park Place, New York, U. S. A.

THE IDEAL CLIP

will hold more papers than any clip of its size on the market. It has

NO UNPROTECTED POINTS.

Instantly applied—observe the cut—there are FOUR impinging points, giving a firm and evenly distributed grip.

PRICES: 15c. per Box of 100.
\$1.35 per Carton of 10 Boxes.
\$1.25 per 1,000 Bulk.

Write for trade prices and discounts, also catalogue of specialties. Postage stamps not accepted.

TO ADVERTISERS.

THE AMERICAN EXPORTER is the only *independent* and *impartial export paper published*. It is *independent* because its publishers are not engaged in any other branch of the export business. They are neither export commission merchants nor manufacturers' selling agents, and hence they are under no more obligations to one advertiser than to another.

It is *impartial* because it treats all its patrons alike. It cannot, for this reason, and it does not, publish write-ups or puffs of any specific make of goods, no matter whether advertised in it or not. It charges the same price for the same services to all alike.

We desire it distinctly understood by those who contemplate advertising in THE AMERICAN EXPORTER that space for advertising purposes is sold only upon the merits of the publication for that purpose. For this reason no advertising solicitor or agency has any right or authority to agree to give reading notices or to perform any special service whatever to obtain orders for advertising.

We make it a practice not to discuss the merits or demerits of other export trade papers. Comments on their value may be made with more propriety by those advertisers who have had experience in the use of such publications.

Softens and Preserves.
Prevents Mould.
Does Not Scale Off.

The No. 7 Hardie Painting Machine

**Does the work of twenty men with brushes,
and does it better.**

The No. 7 Hardie Painting Machine comprises a patented brass pump with brass ball valves, ingenious agitator and paint mixer, contained in a 30-gallon barrel, mounted on wrought-iron wheels, 26 inches in diameter, with 1½-inch tires, and is as easy to wheel as a baby carriage. It is equipped with 10 feet of high-grade ½-inch hose, long extension rod and special disgorging painting nozzle.

**It will save its cost in a few hours' use.
Will spread any liquid of a sprayable nature.**

SPECIAL OFFER FOR EXPORT ONLY:

Upon receipt of \$17.50, U. S. gold or its equivalent, we will box and deliver at New York City one No. 7 Hardie Painting Machine complete. Weight, 110 lbs. Packed in two cases—one, 9 cubic feet; one, 7 cubic feet.

We refer to 30,000 satisfied users of our machines.

The "Stay-There" Ready-Mixed Cold Water Paint

is composed of minerals ground in a liquid chemical, to be thinned with water. Packed in tight, iron-hooped barrels. **IT IS AS DURABLE AS OIL PAINT; will not chalk or peel off; is fireproof, waterproof, washable and sanitary.**

Upon receipt of **SIX DOLLARS** we will deliver f. o. b. cars at New York City **ONE HUNDRED GALLONS** of WHITE "STAY-THERE" PASTE PAINT. Gross weight, 400 lbs.; barrel, 28x28x20½ inches.

Our 1904 Catalogue, illustrating and describing the largest line of Painting Machines for every purpose, and the "Stay-There" Paint, will be mailed free to any part of the world. We will open accounts with responsible importers furnishing American references. Orders accepted through New York commission houses

Rice and Coffee Hulling Machinery

Improved Rice Huller and Polisher.

OUR RICE HULLER

Is the only machine that will take rough rice and in one operation make it merchantable. For simplicity, durability and economy has no equal. They are used on plantations, and also in the largest mills. Both the Coffee and Rice Hullers are made of iron and steel, and can be knocked down and packed for mule transportation if desired.

OUR COFFEE HULLER

Will hull pulped or cherry coffee without breaking or leaving unhulled a single grain. The products will come out clean, polished and free from hulls, ready for bagging, all in one operation. It is the Only machine that will grind the hulls fine, so that they may be sucked by the blower through the screen underneath the machine, leaving every grain of coffee inside of the machine, no matter how small it may be.

Latest Engelberg Coffee Huller.

SEND FOR CIRCULAR OF OUR NEW MACHINES, WITH PRICES AND ALL INFORMATION.

DIETZ Nos. 30 and 60 TUBULAR SEARCH LIGHTS.

These lamps are made for outdoor or indoor use. They give a powerful and brilliant light, and are not affected by the wind.

They are suitable for use in mills workshops, warehouses, stables and summer resorts, or in any other place where a good light is required which will not be affected by strong breezes.

Where it is desired to light up a long row of animals or a long, narrow room of any kind, these lamps are especially desirable.

No. 30 is fitted with our patent bull's-eye lens on perforated plate, adding to the appearance of the light.

No. 30 has a blizzard globe, 1-inch wick and a bright tin reflector 12 inches in diameter. Price, \$30.00 dozen.

No. 60 has a No. 2 globe, 1½-inch wick and a bright tin reflector 16 inches in diameter. Price, \$72.00 dozen.

We are pleased to send complete catalogues (Spanish or English) and price list to those interested.

"The White Lily Washers, Wash Lily White."

Such is the verdict of thousands of users throughout the "States" of the

WHITE LILY WASHER. WASHES LILY WHITE.

White Lily Washer.

The White Lily (Rotary) Washer is made from Louisiana and Mississippi Red Cypress, which is less susceptible to expansion and contraction caused by hot or cold water than any other timber known. Our hinges are put on with bolts instead of screws, and every part is reinforced wherever necessary, thus making the

Most Durable Washing Machine Made.

By the use of a HIGH-SPEED ROTARY WASHING MACHINE you can create a soap-suds or foam without having to turn the fly-wheel so fast that the SPEED, rather than the work, tires the operator.

The speed of the White Lily Washer is 2 3/4 turns of the fly-wheel to one turn and return of the dasher. The White Lily Washer is the Highest-Speed Rotary Washing Machine made. Will create more soap-suds with less exertion, and will wash clothes cleaner than any other known washing machine.

Special Offer to Introduce Abroad:

Upon receipt of **Thirty dollars** (\$30.00) in U. S. gold or its equivalent we will box, ready for transportation abroad and delivered F. O. B. cars at New York City, **Six (6) White Lily Washing Machines.**

Why Do You Continue to Burn Up Money?

FROM 20 TO 60 PER CENT. SAVED IN FUEL.

(For Water Tube Boilers)

The same machine can also be used for return tubular boilers, which is provided with a hammer instead of cutter as it appears on this cut.

DIAMOND BOILER TUBE CLEANER.

The only known and successful device for removing scale and soot from return tubular or water tube boilers. Same machine can be used for both styles of boilers by changing the hammer. From 20 to 60 per cent. in fuel saved; prolongs the life of boilers, and is the means of avoiding possible accidents. Our Diamond Cleaner is used by engineers in almost every part of the world, to whom we can refer you. Every Diamond Machine bears this trademark and is also stamped with our name.

None genuine without our trademark.

No. 3½. Style "D." Panel Doors.

The WATROUS SANITARY SPECIALTIES

The Watrous Combination Bath Fixture.

This fixture supplies hot or cold water or any desired mixture, by simply turning the handle to the right or left. To empty bathtub, simply lift the handle.

It is the only perfectly sanitary bath fixture made, as the tube is always filled with clean water direct from the supply instead of from the tub, and therefore impossible to become foul.

Has an independent supply passage direct to tub. Can be attached to any bathtub. Is constructed with ordinary Fuller balls. Is simple, cheap, durable and heavily nickel-plated.

Upon receipt of price we will box, ready for steamer, and deliver F. O. B. cars New York, as follows:

One (1) Watrous Aquameter Water Closet, complete (Fig. "A 4.") as shown. Six (6) cubic feet. Weight, 100 pounds. \$30.00

One (1) Combination Hot and Cold Water Bath Fixture, as shown. ¾ cubic feet. Weight, 17 pounds. \$15.00

Our sanitary specialties are protected by U. S. and foreign patents.

Our illustrated booklet mailed, postpaid, to any part of the world.

Please mail us duplicate order when ordering through commission houses.

The Watrous Aquameter Water Closets.

Adopted by The Pullman Company and all important Railway and Steamship Companies in the United States.

These closets have no equal for Public Buildings, Residences, Steamships, Private and Parlor Cars.

The closet shown operates perfectly with ½-inch or ¾-inch pipe, according to pressure.

Connected direct to service pipe, without any tank. Uses from one to three gallons of water to each flush. Saves 50 per cent. in water bills. Noiseless and positive in action. Neat and durable. Successful everywhere. Fully guaranteed. Thousands in use everywhere.

FOSTERING FRIENDLY RELATIONS.

BARON VON STERNBURG, the German Ambassador to America, is a conspicuous example of the useful diplomat. It was not so very long ago that members of the diplomatic corps concerned themselves chiefly with matters that were purely political, but a new era has dawned in that respect, and the representative of the Kaiser is fully alive to the progress of international sentiment, if, indeed, he is not slightly in advance of his confrères in doing all that he can to promote the mutual best interests of the country he represents and the one to which he is accredited. In a letter to the editor of this journal the Ambassador had this to say, in part:

"The information you are spreading will not only help us to understand ourselves better commercially, but it will also aid in fostering good relations, which, as history has shown, are the foundation of prosperous trade, and that is what we are both looking for. With hearty wishes for success in your efforts and for the success of THE AMERICAN EXPORTER."

We owe an apology to the Baron for using this extract from his letter, but it exhibits so characteristically the interest which he takes in international trade as it affects not only his own country and ours, but others, that the liberty may be excused for the good that it is sure to do in showing the new trend of diplomacy in the direction of fostering the commercial prosperity of the world, instead of being content with discussing, manipulating and endeavoring to dispose of purely political matters. With Baron von Sternburg at Washington there can be no question as to the pleasant relations that are certain to continue to exist between the two countries.

FRIENDLY TO BOTH NATIONS.

CABLE accounts of the progress of the war between Russia and Japan received in New York have been unsatisfactory and at times misleading. The conflict is one which all friends of progress hoped would be settled diplomatically. Wars are costly to countries that engage in them. They are detrimental to commerce, and are to be deplored from every point of view. We have no doubt that each party to the strife believed no other course could be taken with a proper regard for national honor, and we will not undertake to discuss the merits of the controversy which provoked the resort to force of arms.

We refer to the subject chiefly because through misrepresentation a false notion of the attitude of the United States in regard to the countries involved in the strife has gone abroad. We do not believe that there has ever been a war concerning which so many untrue statements have been printed, not only as to the war itself, but as to the interest in it taken by all powers, including the United

States. The American Government did all it could do consistently to prevent hostilities, and, as we chronicled last month, when it was found the war could not be averted, it did everything possible to restrict the sphere of hostilities. It was obviously something in which our Government could not take one side or the other, and any assumption that it has done so is based upon nothing at all in the way of an excuse for a foundation.

As a matter of fact, the people of the United States feel friendly to both nations. There are exceptions among men and newspapers, who may espouse the cause of either Russia or Japan, but partisans of this sort can be compared to grains of sand upon a thousand miles of ocean beach. The bulk of the American people cannot and will not become involved, either sympathetically or otherwise in the controversy. They abhor war, they are firm believers in the principle that peace and progress are, in fact, synonymous terms.

Russia has been very friendly to us; so has been Japan. We feel friendly to both. We shall still feel so after the war is over, regardless of what hot-headed persons may say in any one of the three countries which are now under consideration.

The war is bound to interfere with trade and commerce so far as it affects the two countries involved, but in this particular instance it is quite likely that the world's commerce in the calendar year will be larger than ever before, although the commerce of the countries involved in what promises to be a protracted strife may suffer to an extent that will be ruinous to many of the Japanese and Russian merchants. It is to be hoped that the war will be quickly ended, but at this writing there is no probability of an early conclusion of the unfortunate suspension of trade and diplomatic relations.

During it all America may be placed, figuratively speaking, in the position of a sister who sees two of her brothers fighting. She likes both of them; she may think both are right or that both are wrong, but after doing all she could to prevent the encounter it is not within her province to aid either brother. "Fair field and no favor" seems to be the generally accepted view of the conflict in America.

CONSUL-GENERAL SKINNER, U. S. A., stationed at Marseilles, France, has made an elaborate report to the American Government regarding the success of his mission in negotiating a trade treaty with King Menelik, of Abyssinia, due mention of which was made in the last issue of THE AMERICAN EXPORTER. The American Consul-General's report tells in detail about the flattering reception with which he met and the successful outcome of his mission, which opens a region containing a population of about 10,000,000 souls to American commerce, provided the treaty be ratified by the United States Senate. Mr. Skinner has faith in the future of King Menelik's country, and believes that it is destined to become a much more important factor than it is at present in international trade. The Consul-General performed his duties in carrying out the work of his mission with rare discretion and excellent judgment, which was no more perhaps than was expected from a consular officer with his high reputation for diplomatic efficiency.

A WRITER in the *Engineering Magazine* asks whether the multiplication of machinery is making specialists of workmen in restricted lines and whether it is tending to put the old-time versatile mechanic out of business. The writer points out how the mills supply, ready made, most of the material that carpenters used to have to make themselves. This condition, however, is true of other industries. In America at the present time the man who continues to be "old-style," whether he is a "versatile" mechanic or anything else, might just as well move to the North Pole. The tendency of the age is to the specialization of work of all kinds, but the man who makes a good specialist is usually one who has grown up in the business in which he is engaged and who could display some versatility if occasion made it necessary. There is no longer any room in America for the man who is a "Jack of all trades and master of none," unless he possesses an independent fortune, which is properly protected against his own inclinations.

NEW VIEW OF OUR EXPORT TRADE.

SECRETARY CORTELYOU, of the Department of Commerce, presents in a report recently issued some very interesting features of our foreign trade. From this report it appears that more than one-half of the exports from the United States in 1903 went to British territory, and practically one-third of the imports into the United States came from British territory. Our total exports to British territory in the calendar year 1903 were \$768,000,000, or 52 per cent. of our total exports, and our total imports from British territory \$308,000,000, or 31 per cent. of the total, speaking in round terms. By British territory is meant the United Kingdom and its colonies, dependencies and protectorates. The territory included under this designation of the United Kingdom and its colonies, dependencies and protectorates, contains over 11,000,000 square miles, or more than one-fifth of the land surface of the globe, and has a population of 400,000,000, or one-fourth of the population of the world.

The largest exportation to British territory, of course, was to the United Kingdom—\$543,000,000—and this was the largest exportation to any single country. Next in order of magnitude of exports to British territory was Canada, \$131,000,000; British Australasia, \$32,000,000; British Africa, \$28,000,000; British West Indies, \$10,000,000; Hongkong, nearly \$10,000,000; India, nearly \$5,000,000, and the remainder scattered through the smaller British dependencies.

Of the foreign commerce of the United States, aggregating nearly \$2,500,000,000 in the calendar year 1903, more than \$1,000,000,000 represented commerce with British territory. Next in order of magnitude of commercial transactions with given countries is Germany, to which our exports in 1903 were \$225,000,000. It is a fact, however, that our commerce with Germany has grown much more rapidly in the last decade than that with the United Kingdom.

Canada stands third in the order of magnitude of exports from the United States, though that country has been included in the general discussion of our commerce with British territory. Our total exports to Canada in 1903 amounted to \$131,000,000, an increase of about 130 per cent. in the decade. France is fourth in the magnitude of its commerce with the United States. Netherlands is next in the list.

Considering the commerce of the United States by grand divisions, that with Europe is, of course, first in order of magnitude. Our exports to Europe grew from \$680,000,000 in 1893 to \$1,087,000,000 in 1903.

DURABILITY OF AMERICAN GOODS.

ONE contributing reason to the growth of the exports of American goods in manufactured lines, especially in agricultural machinery, seems to have been lost sight of by all the writers on the subject. They tell their readers about the general excellence of our articles for export, but they never seem to say anything upon a point which has been noticed by so many of our foreign readers. We refer to the durability of manufactured articles sent abroad from this country. It is a subject to which we have referred incidentally in previous issues, but it is of so much importance to the purchaser that it seems well worth more attention than we have heretofore given it.

There was a time when our manufacturers engaged in the export trade did not take into consideration the needs of their customers to the extent which later on they found reason for doing. In the matter of agricultural implements, for instance, there was a time, long ago, when the same sort of agricultural tools would be sent everywhere, regardless of the requirements of the purchasers, and we may admit that quarter of a century ago some of the men who controlled the manufacture of these articles were not so intensely alive to the necessities of their customers, both at home and abroad, as they are at present and have been for several years.

One American concern engaged in the manufacture of agricultural implements has spent thousands of dollars in an earnest endeavor to solve the problem of durability. That it has solved the problem is shown in the great increase in its trade, paradoxical as

it may seem to say so. Other American concerns have taken up the matter, and our manufacturers generally have profited by the inquiries, investigations and practical improvements in products which have followed. There once were manufacturers who built cheaply to sell their wares. There may be a few of them left, but men of that description are unknown to purchasers of American goods who read only THE AMERICAN EXPORTER. Only firms of known integrity and thorough reliability are admitted to its advertising columns.

With responsible firms in America, the period has long since passed when articles of trade were made merely to sell; and to sell again as quickly as possible to the same purchaser. Take a plow, for instance. Once it was a question of selling a new plow as frequently as possible to the same customer; now it is a matter of making such a durable plow that the customer's neighbors will be attracted and will buy the extra plows, while the original purchaser will do his work for a much longer time, at relatively much less expense, with the same implement. Plows, like everything else, must wear out eventually, but with proper care those made in America will outlast anything that can be procured anywhere.

This principle of making durable articles is fully appreciated by nearly all American manufacturers. They have realized that durability is quite as essential as a reasonable price, and have acted accordingly. It was thoroughly American for them to come to that determination, and we are quite sure that the growth of our export trade is due in a great measure to carrying out this view of fairness and honesty in business methods, which is thoroughly characteristic of the large majority of American merchants.

BUILDING THE PANAMA CANAL.

COMMISSIONERS to supervise and superintend the construction of the Panama Canal have been appointed by the United States Government with commendable promptness, and the make-up of the commission is thoroughly characteristic of the sagaciousness of the American authorities, for the members were chosen not for political or personal reasons, but on account of their eminent fitness for their duties. The chairman, Rear-Admiral Walker, retired, of the United States Navy, has been identified for many years with the investigations and work of the American Government in connection with various plans for a canal across the Isthmus of Panama, and he is probably the best-informed man on the subject in the United States. Considering his experience, it is scarcely necessary to say more than that he is now at his best period of usefulness and that he has the mental and physical vigor which are necessary to reinforce his ample and ripe experience.

The law required that of the seven commissioners four should be skilled in the science of engineering, but the appointing power has done even better than that, for six members are expert engineers of more than ordinary distinction in that profession, and some of them have international reputations. The work of constructing the canal will not lag. In fact, it has been progressing under American auspices for nearly a year, but now fresh impetus will be given to it, and the new commission will see that nothing is left undone that will hasten the completion of the new short cut between New York and Australia.

The promptness with which the American Government has acted in this matter is a substantial and gratifying vindication of the position taken by THE AMERICAN EXPORTER early last year when the United States authorities awaited the action of the Colombian Government with such marvelous patience that we were asked by several of our correspondents abroad, particularly in Australia, as to whether the United States was going to do anything or not. We assured our friends that the United States would build the canal regardless of opposition, and that this important step in international progress was not so far in the future as it then appeared to be.

AUTOMOBILE railway trains are all very well in their way, but they will never replace the regular railway trains run on rails, for neither speed nor safety can be secured to an extent that will make them competitors of the vehicles which use the rails.

WORTH OF AMERICAN WORKMEN.

THOUSANDS of our readers abroad can testify to the excellence of the work of American workmen, as shown in our manufactured products, which they have examined and tested. The workmen receive higher wages than are paid in corresponding positions in most other countries, and according to a writer in the *World's Work*, they produce results which warrant such payments for their producing efforts. We are not accustomed to make unfavorable comparisons between our methods and those of other countries, and do not do so now, but some of our thoughtful readers will be interested in what the *World's Work* has to say on the subject, which is, in part, as follows:

"Some employers ignore the fact that the American wage-worker is the swiftest and most efficient producer of wealth in the world. American manufacturers who have started factories in Europe testify to the great difference between American and European workmen. For instance, an American match manufacturer, who is now doing business in Germany, says that German workers are so slow that his matches cost him as much as if they were made in this country. He says:

"I pay much lower wages than those paid for the same class of work in America. But the difference is offset to a large degree by losses of time due to the shutting down of the plant in the forenoon and afternoon for meals, by the frequent holidays in Germany, and by the smaller amount of work turned out by the men in a day."

"The cost of printing cotton is half a cent in England and one-twentieth of a cent here. The Massachusetts factory worker gets 8 per cent. more wages than the unorganized workers of South Carolina, but the Massachusetts man produces in a year \$715 more than the other for his employer. Shoemakers in Austria get \$7 a week, while in Lynn they get \$12. But the labor cost of shoes is more than twice as much in Austria as in Lynn. This proves that workers as well as wages should be compared."

In some lines of effort that would more particularly interest our readers comparisons are difficult, and we only quote what the *World's Work* says as a matter of contemporaneous interest. The growth of our export trade testifies to the real worth of the goods we sell, regardless of what the workmen may be paid for their labor. At the same time, thoughtful purchasers are apt to ask why American manufacturers can sell such excellent articles at such reasonable prices in the face of the higher cost of labor which they must meet and pay. The answer is easy and simple: It is in the atmosphere of the United States. The average American workingman, even if he is of foreign birth or extraction, is imbued with the progressive spirit of the country. We have no place for drones anywhere in the workshops of America. The men who measure their minutes of work with the idea of allowing their employer to get as little out of them as possible are not numerous. The employers who *drive* their workmen are fewer still. There is generally a spirit of honest reciprocity. The employers expect the men to "make good"—to use a colloquial expression—but they will not drive a man. Men who require driving are undesirable everywhere, and a few dismissals—perhaps one—will change the tenor of most men's view of what they ought to do. Employees who may not be satisfied from some points of view and who are at all observant find that promotion lies chiefly in doing their work quickly and well. They may have to wait for the promotion, but the sensible ones soon lose sight of imaginary grievances and show the necessary interest in their work with correspondingly good results. There is really something in the American atmosphere that breeds energy and progressiveness. Of course, Americans get much of the resultant benefit, but the purchasers abroad of our manufactures share equally with us, for they are getting in every instance the very best article that can be produced for the money charged for it.

PORTO RICO continues to exhibit increased evidences of the prosperity that began when the island was annexed by the United States. The commerce between the two countries has increased in the five years from \$4,000,000 to a trifle more than \$20,000,000.

ART OF MAKING RAZORS.

RAZORS, a few years ago, could not be made satisfactorily by Americans. There seemed to be some subtle artifice in the production of perfect blades that was inherent in and exclusively possessed by the makers in the countries of the Old World. The production of razors has been called an art; it may also be called a science. The perfect razor, at any rate, is to all men who use it a highly developed product of the arts and sciences combined. Other men can never appreciate what the perfect razor means, nor can men who have not experimented in their production have any idea of the difficulties involved in tempering the blades so that they will hold the edge and do duty in a way that will afford not only comfort but gratification to the person who finds it needful to shave.

Attempts to make razors have been made for many years in America, but it was not until within the last five years or so that the efforts resulted in the production of anything more than second-class blades, or even more inferior ones. A razor that is not first-class is next to useless. It is a source of trial and tribulation. It is something that would drive some men to desperation. But all of these incitements to profanity are now to be banished, for American razors are becoming so good in temper and quality that they no longer jar the nerves nor spoil the tempers of their users. Temper is everything in the razor industry. The steel must be properly tempered to keep its edge and do its work. Experts now say that the Americans have at last been able to temper the steel to the proper color and that they are producing goods that hold their own with the best of foreign workmanship. The industry in America has made wonderful developments in the last five years, and the results are a tribute, not altogether unexpected, to the perseverance and pertinaciousness of the artisans who have been engaged in trying to solve the secret of the craft. The reader who is unfamiliar with the work can scarcely realize the intuition, to say nothing of the skill, which a razor-maker must possess. He must be able to tell the precise moment when the changing color of the steel is going to point to ruination for the blade, rather than to the perfection which he seeks. To one who has watched it, the tempering of steel seems to be more of an art than anything else. It is as fascinating as many of the transformations that chemists accomplish in their laboratories, and the success or failure of the efforts of the artisan who tempers a razor blade no less depends upon what may be called providential foresight and instant appreciation of the reactionary effects of the material handled than does the safety of the chemist depend upon his knowledge of the forces with which he is working.

The industry in America has not yet reached the export stage. Our artificers have only just begun to convince their fellow-countrymen that they can make as good razors as can be produced anywhere in the world. People who are familiar with the industry will recognize that it is an important step in the industrial progress of the country, and it is for that reason alone that we give the subject so much attention at this time. When those engaged in the industry are prepared to enter the world's markets due information will be given to our readers.

POSTAL receipts give a reasonably good idea of the prosperity of a country. The fifty largest post-offices in the United States showed a net gain for February of \$187,550 over the same month last year. The New York office exhibited an increase of nearly 10 per cent., and the average was close to 3 per cent. In commenting on a similar return a year ago, we remarked that while the increase from month to month was small comparatively, yet the fact that there was this increase every month gave good evidence that the growth of the country was upon a substantial basis. The reports have been better in the last year than ever before, but there has been no unexpected increase that might call for discount in the future.

ELSEWHERE in this issue will be found some interesting facts about the marvelous growth of the export trade of the United States. The figures for last year will surprise even some people at home who may not have watched the gradual and healthy progress made in the last decade.

NEW YORK'S NEW TUNNEL.

NEWSPAPER men representing some of the chief journals of the country one day last month walked under the Hudson River, which separates the City of New York from New Jersey. The distance is over a mile, and the completion of the tunnel through which they passed calls for some remarks on the engineering in the America of the present, as compared with the past. This tunnel is the first to be completed of the many planned for increasing the facilities for travel between New York City and its suburbs that are separated from it by water. From an engineering point of view the tunnel is not such a remarkable one, and it will dwarf into insignificance when some of the newer tunnels are constructed, but all the same, this tunnel marks an important step in the progress of the city and of the country.

Our readers may well hesitate to believe that this single bore under the Hudson River was begun thirty years ago. Various sets of capitalists worked upon it, and there were periods of years when little boring was done. It was only a year or two ago that the present owners started to finish the job. They pushed the completion with such skill that the tubes from each side of the river met near midstream with a variation of a small fraction of an inch. They propose to build a sister tunnel, and expect to have it done within a year. Electric cars will use the tunnels, and the quick connection afforded between the heart of New York City and suburban New Jersey will be of incalculable benefit to hundreds of thousands of people.

The lesson of interest from the point of view of progress is that when the tunnel was started thirty years ago it was expected to be a matter of perhaps eight or ten years' work to finish it. Now it is figured that with modern American appliances the duplicate tunnel will be done in just one year. The other proposed tunnels, across the same river, although larger than the ones just mentioned, are to be built in correspondingly quick time. Without going into technical details, it is difficult to give our readers an adequate idea of the wonderful progress that has been made very recently in this branch of engineering. Aside from the genius displayed by our American engineers, it must be confessed that the manifold uses of electric energy have had much to do with development of this phase of the transportation problem.

COLOR photography has greatly interested American photographers and chemists in recent years, and the subject is one of sustained effort on the part of many of them. Distinct strides have been made in making prints of almost every known color, but these prints are monochromatic. So far it has not been possible to blend the colors, and expert chemists declare that this can never be done until they can find some other sensitive salt than that of silver or platinum. That there is such a salt is generally believed, and that its discovery will revolutionize photography is equally conceded. The secret is worth a king's ransom, and of the many Americans who are striving to gain it there is likely to be some one who will obtain the precious knowledge quite as much by fatuous fortune as by more intelligent effort than that put forth by his fellow-seekers after the identity of the mystic salt. Real color photography will undoubtedly be one of the twentieth century's gifts to the world.

SOME of our contemporaries have said "things" about the United States Steel Corporation. Its annual report, just issued, shows that its net earnings in 1903 amounted to \$109,171,152, and the surplus is \$66,096,682. This was less than the previous year, but not so bad as some folks would have other people believe. The decrease was due to the adjustment of natural conditions, and not to any diminution in the business of the corporation. This big developer of the American iron and steel trade is colloquially known as a "trust." We recently pointed out the fact that instead of being what it is offensively called, a "trust," it had many thousands of owners, or shareholders. In that connection it is interesting to note that the exact number of persons now owning an interest in it is 79,957—very close to 80,000, enough persons to make a great many armies.

OUR MERCHANT MARINE.

READERS of THE AMERICAN EXPORTER are not greatly concerned in the nationality of the ships which carry our goods to them, but our exporters are more or less interested in the subject, and we frequently receive letters and circulars from Americans who decry the progress this country is making in upbuilding the merchant marine. The object is not so much to try to discredit American shipbuilding as it is to secure subsidies from Congress, a subject with which we have nothing to do, but as the effect of the work of these gentlemen has been to give a false view of American progressiveness to people far away, it seems proper to say that the United States is "doing very well, thank you," regardless of subsidies or lack of them. Readers of THE AMERICAN EXPORTER have probably gathered from its columns the information that would show the recent growth of the shipbuilding industry, the confidence of men of wealth in its future and the faith they manifest in the expansion of our foreign commerce, based upon the increased demand for our goods.

We do not take issue one way or the other with advocates or opponents of subsidy privileges to ships, but the American merchant marine shows up so much better in a recent report of the Department of Commerce that some mention of the fact seems to be quite proper. According to the report Great Britain, as was to be expected, maintains the lead in numbers and tonnage of both steam and sailing vessels, but the United States ranks second in tonnage of sailing ships and third in tonnage of steamers. The report says:

"How long Great Britain is to maintain her present position is to depend very largely upon the still further development of the foreign trade of the United States. If the average annual increase recorded in recent years is kept up, the United States is soon to do a very large part of the world's total exports and imports. When that time comes the United States will doubtless have much more than its present ratio. If it is to develop as it should it will have to have its own ships."

The American shipbuilding industry has within a recent period received an impetus that will prove of importance both to our foreign customers and to our exporters. This branch of our present activity has been slower in getting into action than most of the other divisions of commercial effort, but much more is involved, and it will soon be keeping pace with the others.

DO you want to buy any warships? America makes pretty good ones. The big Russian cruiser *Retvizan*, built in the United States by American mechanics, seemed to be endowed with some of the characteristics of her builders in life, energy and endurance. According to the cable reports, she was sunk or destroyed three separate and distinct times by the Japanese warships in attacks made at Port Arthur. The *Retvizan* refused to remain sunk or stay destroyed, but finally got stuck in the mud in the harbor, and was used as a floating fort. It is pretty hard to destroy American machinery, and anything we produce in the line of war machines or agricultural implements to till the soil in times of peace is equally certain to show good results. Both the Japanese and the Russians know this fact, and the war will give them further evidence of it, for both countries have been liberal purchasers of commodities that we are able to furnish and which they need.

SULLY, the great American cornerer of cotton, has met the fate which we predicted last month was only a question of time. He was forced to suspend business on March 18th, earlier perhaps than was anticipated, but none too soon to please the sufferers of his vicious tampering with the price of an important commodity which figures to a considerable degree in the world's commerce.

INCREASED exports of pig iron and steel have attracted the attention of some people who do not keep well informed. The few thousand tons sent to Europe do not signify much at present, but in view of the counter-movement that came very near getting into swing last summer, the small but cumulative increases are noteworthy.

GUN WILL SHOOT 25 MILES.

New American Weapon Built with Such Strength That It Cannot Explode.

WHILE John Hamilton Brown, the American inventor, is busy in the mechanical den at his residence in Reading, Pa., the sturdy iron and steel workers in the historic Scott Foundry, of that city, are busy perfecting his now famous segmental wire-wound gun, says the *New York Times*.

Inventor Brown asserts that a gun joined together like overlapped clapboards and wound with thousands of feet of the best steel wire makes the strongest and best ordnance in the world. Workmen are now completing a 6-inch wire gun 26 feet long, weight 20,000 pounds, and calculated to hurl a projectile thirty miles. The United States Government has made available about \$700,000 for twenty-five 5-inch guns and twenty-five 6-inch guns, and the War Board has directed that a 6-inch one be produced for testing. Naturally, Mr. Brown is an enthusiastic ordnance man, and has every confidence in his creation. He says that it is an impossibility to explode it with gunpowder, no matter what enormous pressure may be exerted upon it.

Mr. Brown described the attempts which have been made to overcome the various defects in guns. His own efforts consist of building the gun of many overlapping plates, which are afterward wrapped with wire. In this wire and the manner of wrapping it the great strength of the gun lies. By means of a special machine constructed by Mr. Brown for the purpose 2,500 pounds is constantly on the wire, while it is being wound in strands, increasing from seven at the muzzle to twenty-one at the breech. The tension on a square inch of wire is about 125,000 pounds, which makes so great a compression that it is contended that no possible powder pressure ever will put the tube under tension.

Over this wire is being shrunk a trunnion jacket of steel. The whole is braced together by a system of shoulders, so that it is impossible to pull the gun apart. The wire used in wiring has an elastic limit of 150,000 pounds and a tension strength of 225,000 pounds to the square inch, while the sheets of steel have an elastic limit of 80,000 and a breaking strength of 100,000. The tests of the forging show 60,000 and 100,000.

In the gun, the inventor thinks, the danger of explosion is practically eliminated, for there is said to be no unknown quantity. The principal material used in the gun, and from which it derives its great strength, is wire. Wire is the highest physical condition into which metal can be worked. The work of constructing is done under the personal supervision of Mr. Brown himself.

Col. John M. Ingalls, United States Army, retired, who is regarded as the greatest ballistic authority in the world, says that a 10-inch Brown wire gun, which will be of the same proportions as the 6-inch one, now nearly completed, will have a range of more than fifty-nine miles. In it sixty pounds of powder will be used.

A navy equipped with such guns, it is contended, could bombard any city that was not over forty miles inland without having any of the warships come within sight of the shore. One of these guns, they say, will penetrate more armor four miles from the muzzle than the best 10-inch gun now afloat or ashore will pierce at the muzzle.

About one-third of the weight of this gun is wire. Another third is of flat steel plates, which cost less than the wire. The other third is steel forgings, etc., at about the same price, which Mr. Brown claims produces the cheapest gun in America, about 21 cents a pound. The machine work is also low priced.

The gun now building will have a wire jacket wound on it with a tension of 15,000 pounds to the square inch. There are three inches of wire over the breech. This wire jacket then lapses down to one inch at the muzzle. There is a nickel-steel lining tube an inch thick running through the entire length of the gun. The shot will weigh 100 pounds. The chamber is nine inches in diameter. Mr. Brown expects to fire his gun at Sandy Hook, New York harbor, before long under a pressure of 60,000 pounds to the square inch. He will fire the gun with a 3,500-foot per second velocity, which is 500 to 700 feet faster than the best guns now in the service. At an elevation of 45 degrees a shot will carry for twenty-five miles.

New American System of Wireless Telegraphy.

APPLICATION has been made to the United States Government for patents on a system of wireless telegraphy invented by a young American, which is pronounced by persons who have examined it to be likely to bring wireless communication appreciably nearer to commercial practicability than anything that has been done so far in this field of research. The inventor, George S. Piggott, has been an ardent student of electrical science and chemistry for ten years, and for the past two years has been experimenting on what he claims is a much simpler system of wireless transmission than any now known. He has made innumerable tests over various distances, from a few feet to hundreds of miles, but it was not until his latest and most successful demonstration between Chicago and St. Louis was made recently that his secret partially leaked out, so carefully had he guarded his operations.

The complete success of this latest long-distance demonstration, the distance between the two cities being more than 300 miles, has confirmed Mr.

Piggott and his friends in the opinion that he has made a valuable discovery, one which he now has no doubt will prove of immense commercial as well as of scientific value. In the first place, he uses a code consisting entirely of dots, dispensing with the dash found in the Morse code, and substituting therefor double dots, thus reducing to almost nothing the possibility of errors in the process of transmission.

Another distinguishing feature of Mr. Piggott's system is that poles or high aerial conductors or radiators are not needed at either the sending or receiving station. For long distances the inventor says he has made use of a ground connection, but he has succeeded in transmitting messages over seventy-five miles without the ground connection, and it is his opinion that this feature may eventually be entirely dispensed with for all distances, however great.

The instruments used in his demonstrations are all of Mr. Piggott's own invention or arrangement, and so far are in the crudest state. He does not attempt to give a scientific description of them, but says that he has constructed them specifically for the purpose of intensifying the ethereal surging effect of the receiver; or in other words, to intensify the insurging or displacement, an effect which, he says, renders unnecessary the employment of aerial wires or poles, and of ground connections, which play such an important part in the paraphernalia of other systems. Mr. Piggott appears to have based his invention on the theory that ether, which pervades all space, is semi-metallic and solid, and that the displacement of one particle in any part of the universe causes the displacement of every other particle. Mr. Piggott's merit as an original discoverer must, therefore, lie in the establishment of his claim that he has succeeded in producing an electric spark which differs, both in quality and form, from all electric sparks, and which, in consequence, produces a displacement of ether, which is entirely characteristic of this particular spark. He has also brought into use in his demonstrations a system of electric films, the purpose of which is to render as near perfect as may be possible the sympathy which it is desirable to maintain between the receiving and the transmitting instruments.

When the test was made between St. Louis and Chicago the receiving instrument was situated in the inventor's home, in Chicago, and the sending instrument located at a residence in St. Louis. The signals "G. S. P.," ticked on the sending instruments at the St. Louis end by Mr. Piggott himself, were received at his home by his mother constantly during half an hour, she returning them. The signals were received promptly at the time agreed upon, and there was nothing of hesitancy or uncertainty noticeable in the impulse, which came plainly and strong.

Both the sending and receiving instruments used by Piggott in his demonstrations are placed upon glass jars or pillars, thus completely insulating them, and this is given by him as a further proof that transmission is possible without ground connections. The main secret of his machine, however, lies in the "electric films," according to Mr. Piggott. The difference in the density of these, he says, will enable him to make it possible to construct instruments that will be in perfect sympathy with certain other instruments. This will permit the use of such instruments without any fear that secrets may be stolen.

"About a year ago," says Mr. Piggott, "I made the discovery that what I have called 'electric particles' can be created and separated. As I am a chemist, I have used that science to discover the most essential points in my invention. I have studied other systems of wireless telegraphy and have always taken a great interest in high tension electrical action."

Pure Food Law Works Both Ways

PURE foods from abroad have been coming into the United States without any hindrance since the new law regulating the subject was put into force. Chief Chemist Wiley, of the Department of Agriculture, says that there has been less difficulty in enforcing the law than was expected. It has operated, moreover, to the possible advantage of consumers of American foods. Dr. Wiley says as to that:

"American exporters of food products are rapidly learning the advantages of having the stamp of approval of the Department of Agriculture on their goods put up for foreign consumption. On request we analyze and testify to the purity of all kinds of food intended for export. This certificate is of tremendous advantage to the American shipper. Here is a case we have just disposed of, which illustrates how religion and science are sometimes mixed. A New York house wanted to export to Turkey a substitute for lard. Moham-medans are not permitted to eat pork, so hog fat has little sale in that country. We analyzed the samples and found that they were free from hog fat, furnishing an official statement to this effect.

"Here's a bottle of fine-looking Chili sauce which proves my contention that tomatoes can be put up in attractive shape without the use of coal-tar dyes. There is not a particle of that chemical in this product, which is of an excellent color. Now here's a bottle of cherries that contains a large quantity of coal-tar dye. It is used to give the rich cherry color, you see. The people will learn eventually that coal-tar dyes are sometimes harmful and then they will no longer be used."

American Shoes in Syria.—United States Consul G. Bie Ravndal, Beirut, Syria, reports: "Lately American shoes have appeared in Beirut, and they have been so favorably received, particularly shoes for children—also rubber goods—that a Syrian has brought from the United States the necessary machinery (besides lasts, leather, etc.) for manufacturing boots and shoes on the American plan."

FIGHTING BLIZZARDS.

How Electric Railroads in America Keep the Cars Going During Snow Storms.

BLIZZARDS have been frequent in the winter just about ended, and the weather has not been so severe in the United States for a long stretch of years. Our readers in tropical countries can hardly appreciate what the effect of some of these great storms is upon traffic, both in New York and elsewhere in the country, but, like everything else in America, the railroads have a perfect system to meet Nature's attacks upon their serviceability. The *New York Times* recently printed a very readable article on the subject, which shows the scope of organized effort for emergency purposes that is in existence in New York City and in a corresponding way throughout the country. The *Times* says:

"When the average New York business man wakes to find the streets snow-covered and the flakes still falling, or watches a winter storm gather and break, the first question he is apt to ask himself is, 'Will the cars stop running?' This question, which gathers force with the duration of the storm, is all unjustified. He sees a massive sweeper roll by in a thick cloud of white, but the drifts, as they deepen, increase his doubt as to the ability of the street car company to continue operations. He pictures the work of keeping the tracks clear as being in the nature of emergency service, unorganized, created by the spur of necessity, liable to defeat.

"As a matter of fact, the first flake of snow which touches a New York pavement releases the initial link of an endless chain of preparation which defies a deeper snowfall than New York has known for fifteen years. On the instant the entire basis of operation is changed, and the 'snow schedule' is in force. The principle on which this schedule has been worked out is that a snowflake means a heavy snowfall. There is no loophole left open through which confusion may enter. The 250 miles of track are, so to speak, under martial law. The forces of the company for resisting the snow assume shape and take their stations with the discipline of a garrison when the call to arms is sounded. Nothing is taken for granted. The company is ready to engage the full stress of the elements.

"Within an hour every sweeper is manned and prepared for work. A small army of drivers reports at the barns in which the 'walkaways' are kept. A regiment of switch tenders reports for duty. A battalion of picked men whose duty it is to keep the hill tracks sanded is on hand, awaiting orders. The entire organization of employees, 12,000 men in all, with 1,000 horses and half a million dollars' worth of snow equipment, with the easy, resistless sweep of well-oiled machinery, responds to every call as it comes. These figures are not the result of guesswork. They were furnished the *Times*, as were the facts concerning the 'snow schedule,' by the management of the street car company.

"The main reliance of the company is, of course, its equipment of snow sweepers. There are ninety-two of these sweepers in all, each of which cost \$3,000. This number gives a sweeper for every two and a half miles of track in the Manhattan Borough section of New York City, and permits the clearing of every foot of tracks four times an hour, if necessary. Only once this winter have all the sweepers been out at one time, and then it was only necessary to keep them out for a few hours. The sweeper crews are composed of picked men. It requires special knowledge and special skill to run them. Motormen on a sweeper who receive in ordinary times 25 cents an hour are paid 40 cents an hour from the time they report for sweeper duty until they are no longer needed for the work and go back to their usual posts.

"If snow begins to fall at midnight, and every man on the sweeper detail—they are all old employees and have good runs—is at home or in bed, they are waked and on duty in an unbelievably short time. It would take several hours if one or two men were relied upon to go from house to house and summon each and every one of them. Instead two callers go to two of the men on the detail and rouse them. The four men continue the rounds, waking four others; the eight men keep the ball rolling. So the doubling up continues until the task is accomplished. The same principle is followed in all the departments.

"The sweepers are followed by the 'walkaways,' which are giant scrapers, built with wings which push the snow back for several feet on either side of the tracks. The sweepers only clear the tracks and for a space of a few inches on either side. It takes four horses to pull a 'walkaway' and two men to man one. There are 120 'walkaways' distributed, as are the sweepers, at the most advantageous points on the different lines.

"On the sweeper detail there are 388 men, or two shifts. For work on the 'walkaways' 480 men are allotted. The company owns 500 or 600 truck horses, and these are put on the 'walkaways' when the company goes on its snow footing.

"The lightest fall of snow, if accompanied by a temperature below freezing, plays havoc with the switches. A detail of 800 men, 400 on a shift, sees that they are kept clear. They are furnished with buckets of salt, but they use the supply only when a switch is irretrievably frozen up, for salt plays havoc with the electric apparatus, short-circuiting the motors and burning up the channel rails. In slippery weather the grades on steep hills offer difficult propositions. The rails must be kept constantly sanded to keep the car wheels from slipping, and eighty men are assigned to this task, some afoot and some with carts.

"In fighting a snowstorm the whole territory covered by the track is redi-

stricted for the work on hand. There are special details of electric workers, each under a regularly selected emergency chief. Each foreman has his snow foreman; each channel rail gang its regular snow leader. Even the repair department is on a war basis.

"Arrangements, made annually, provide for the comfort of the men who are on storm duty. Coffee is kept hot in the barns for the sweepers. There are provisions made for a twenty-minute instead of a five-minute swing at the end of each run, that the crews on the cars may thaw out. Each man is furnished with coffee tickets, entitling him to two cups. Everything possible is done to keep the workers fit."

New Mechanical Amusement Device.

AN American inventor has put forth something new in the mechanical amusement line. It consists of two towers rising alternately to a height of 125 feet on tubes that are forced upward by compressed air. The operating mechanism is under ground and the larger cages are pushed upward by means of the air working on the telescopic tubes. Each cage when raised to its highest altitude looks like a large barrel poised on a whisp of straw, and it was at first thought to be unstable, but tests have been made that show the device to be practicable and reasonably safe.

Ordinarily we do not go into details regarding the construction of mechanical devices, but in this case some brief statement may be interesting to our readers, for the contrivance is likely to prove to be a drawing-card in amusement resorts, especially parks and fairs, both here and elsewhere in the world. The telescopic tubes are made of one-half-inch steel, each section being 25 feet in length. The top tube is only 12 inches in diameter, but the cage mounted upon it is large enough to carry twenty-five people, and when the telescopic tower has been raised to its full height the cage can be made to revolve, so that occupants who remain seated may be able to view all of the scenery. Electric lights and other attractions go with the tower.

A single telescopic tower can be operated, but for economical purposes two towers produce better results in operation. If trips are made alternately the weight of the descending cage would force back air that would help to raise the ascending one, although some air-power would have to be used to accelerate the action of the mechanism. One man who has made the skyward trip said afterward: "I felt like a man might feel who was perched on a haystack mounted 'way up in the air on the point of a long needle." That is a sensation that some people would like to enjoy. If the promoters are able to interest capitalists in the device the telescopic tower will be as great an attraction as the famous Ferris wheel at the Chicago World's Fair in many more places than Ferris wheels could be built. It is worth noting that twin towers with all the mechanism involves an outlay of only \$20,000, as against four or five times that sum which the Ferris wheel cost.

The inventor intends to apply the principle of his device to commercial purposes and will try to adapt it to elevators in office buildings.

Foreign Markets for American Machinery.

A LONDON correspondent of the *American Machinist* contributes to current commercial information which is perhaps of more interest to American manufacturers than to our foreign readers, but which shows by suggestion how highly this British writer holds our products:

"Makers of American pumps, motors, windmills, etc., would do well to note the success which has attended the artificial irrigation of relatively small areas of land in New South Wales. There is an opening in that colony for pumping machinery, motors and other power generators, such as, for example, windmills and steam, oil and hot-air machinery. It may perhaps be advisable to sell such goods through agents who understand how to put machinery together. There are firms in Sydney who sell such lines as mentioned above for British and other makers, and they would no doubt deal in new ones if good and cheap. As regards heating apparatus, although the Australian winter is short, yet in some parts it is severe enough to render artificial heating necessary, especially in schools, churches and shops. At present the ordinary open fireplace is used, but it is very expensive in fuel, and is also ineffective. A manufacturer of heating apparatus would do well if he went about it in an energetic way. It would be necessary to send out an expert on hot air and hot water and open a warehouse, but in the end he would get the business. Your exporters of wire netting, iron rails and gates and barbed wire should note that there is every indication of a heavy demand arising in New South Wales for these manufactures."

Americans to Build Russian Bridges.—Plans and specifications for the construction of two new bridges across the River Neva, at St. Petersburg, have been accepted, according to a report received by the State Department from Ethelbert Watts, United States Consul-General, stationed in the Muscovite capital. Mr. Watts also writes: "There are two other bridges, one over the Fontaka and another over the Ekaterinhovka, in contemplation for construction. The contract for the latter, it is expected, will be given to American engineers."

American Phonographs.—"A remarkable thing is the number of American phonographs which have arrived in Bogota lately. Six months ago I did not see or hear one, but now on almost any evening you can pass in various parts of Bogota and see small crowds listening outside of some windows to the latest 'Yaqui' wonder to reach the top of the Andes."—A. G. Snyder, United States Consul-General at Bogota, Colombia.

DEADLIEST OF MODERN RIFLES.

American Invention Which Prove to Be a Powerful Argument Against War.

ARBITRATION will be in greater demand than at present when a new rifle, invented by an American, becomes generally adopted. The gun has been tested by United States officials and pronounced feasible, and a former general of the army is president of the company which will manufacture the weapon. It beats all the machine guns so far put into service and could not fail to do terrible havoc if directed against an army. The inventor, a physician, named McClean, succeeded in interesting various military and other men in his machine gun some time ago. His first step was to produce a rifle that did not recoil. At that time McClean had only his rifle. He did not have the money to experiment with heavier guns, but his rifle was a success. He could whirl a wheel three feet in diameter at the rate of 1,500 feet a minute and shoot into the edge of it. The bullet holes would be exactly one foot apart, indicating that the gun was shooting 1,500 rounds a minute. Bankers and military men heard about it and went down to the little shop. It was not long before McClean was invited to Washington, and now the Government has given him an order.

The rifle looks much like any other weapon of that sort. The only difference is that it has a little instrument attached to the muzzle. This thing looks like a miniature water bottle, being about that shape. It is perforated at the sides, seemingly for artistic effect. But if there was ever anything which had stern utility about it that little instrument has. And every hole in the side is cut with the exactness of a part of a great telescope.

Dr. McClean is a man with soulful eyes, and is somewhat of a dreamer. He dreamed about this gun in Iowa and decided there was no reason why a gun should kick. The little instrument on the end of his rifle is the result of his dreams. He went on the theory that to throw a bullet or a ball or shell a mile or more there must be tremendous power back of that projectile. He believed that this power could be caught as it left the muzzle of the gun. He determined to try it, and he succeeded. That little machine on the end of the gun is the result. It is nothing more than a vest pocket gas engine.

This bottle-like instrument is attached to the end of the gun bottom outward. The bell-shaped portion of it is supposed to catch the gas as it comes out of the gun. But if all of it were caught the gun would go flying after the bullet. The holes bored in the sides are to let out that part of the escaping gas which is not needed. The part retained is turned back through a chamber running along under the barrel of the gun. This takes up the recoil, discharges the empty shells and reloads the piece.

Being nothing more than a simple little gas engine, it can work like chained lightning, and 1,500 rounds a minute is far from being out of the question. The rifle is so arranged that if one wants to keep shooting all he has to do is to get ready a supply of cartridges, so they will feed into the hopper, then push the little knob and pull the trigger. The gun will keep on shooting until the barrel melts or the supply of cartridges runs out. Dr. McClean has a cheerful and imaginative soul. He suggests what it would be like to arm 1,000 men with such guns and have them trained on the enemy a half mile or a mile distant. Then he wants to know what would be left of the enemy after a minute or two of that sort of firing.

After he had completed the rifle the doctor made a shotgun that would not kick, but that had nothing specially to do with his argument for arbitration, and the shotgun was shelved until he completed more important work. Now he has mastered the pompon, or 1-pound gun; has a 13-pounder practically under control and is trying to tame big navy mortars, which tear up the decks of the ships every time they are fired.

When Dr. McClean began on the pompon it was a fussy little thing that created more disturbance to the square inch than anything yet manufactured. The gun weighed about 1½ tons, and when fired would recoil 30 or 40 feet and was most likely to turn flat over on its back and tear up the ammunition wagon. Dr. McClean says he has it tamed now so that it is set on bicycle wheels and is fired like a rifle, kicking less than an old-fashioned shotgun. On hard cement it recoils about one inch to the shot. One may sit on a bicycle seat back of this gun and fire it for hours and never be jarred by it, according to the inventor's statement.

One aim was to control the piece so it would not be necessary to reaim it after firing. Not long ago the gun was being shot out into Lake Erie at the rate of 300 shots to the minute. Five holes, it is said, were made in a skiff 13 feet in length before it had time to sink. The shots were fired by an army officer, the skiff being two miles from shore. At another time five shots were put into the same hole in a tree a mile distant.

With characteristic cheerfulness Dr. McClean tells of the advantage of this piece. He says it is impossible with the small rifle to shoot a man with any surety of hitting him at more than a mile and a half. The doctor says that the 1-pound gun will shoot a man when he looks about ankle high on the horizon, or about three and a half miles. It is a sure shot at two miles or two miles and a half, and does not need to be reaimed when once fired.

The doctor's idea in constructing this piece of death-dealing machinery was to stop an army before it can get in range of the small rifles. Heretofore it has never been possible to do any skilful execution with a 1-pound gun. Combatants have had to take general results. Now they take aim and make every shot count. This is what Dr. McClean calls doubling the fighting zone. An army equipped with this gun can keep its opponents off at a good distance and

annihilate them. The doctor declares that he has a gun which can mow down armies. The United States and the governments of Europe are investigating to see just how much truth and how much boast there is about the weapon.

To Fix Limits of Cold Storage's Benefits.

DR. WILEY, the chief chemist of the United States Department of Agriculture, has begun an investigation that will be of world-wide interest. These are some of the questions for which he will seek answers through making practical experiments: Is the use of meats, fruit and other foods that have been preserved for a great length of time in cold storage injurious to health? Has the utilization of cold storage in keeping food products for indefinite periods been pushed too far? Regarding the scope of the inquiry Dr. Wiley says:

"We will investigate the effect of cold storage on foods of various kinds and also the effect of eating foods that have been kept in cold storage for long periods. We want to determine how the wholesomeness and nutrient properties of foods are affected by this treatment. Cold storage may be carried to an extreme, and as it seems to be a popular method of preserving foods of various kinds we wish to throw some light on the subject. It is something that has never been investigated.

"We know now that when meats are kept too long in cold storage they lose their flavor, and hence do not excite the digestive secretions in the proper way, and thus have a tendency to lose their nutrient and digestible properties. I know of certain choice cuts of beef and of birds that have been preserved in this way for years. After a certain point they deteriorate in quality. On the other hand, it is known that many foods improve in cold storage up to a particular point. Meats treated in this way become tender and develop a fine flavor, while fruits are affected in the same way. We do not propose to overlook the fact that cold storage works both ways, and that it increases the wholesomeness and palatability of some foods after a certain length of time, and that it robs them of these qualities after a certain limit has been reached. We propose to determine what that limit is.

"Cold storage has proved a great boon to the producer, the dealer and the consumer, and we do not want it understood that we are going to condemn the custom. We expect that the professional cold-storage men will cooperate with us in the inquiry. We will make chemical and nutrient analyses of various foods taken, from time to time, from cold storage, continuing the experiments until we determine the maximum improvement and the beginning of deterioration."

Special Trains Needed to Transport Our Flour.

THE great demand for flour, both for export and domestic use, has brought about an innovation in the transportation of foodstuffs. It has taken form in a special daily railroad train, called the "Flour Special," which runs between the great grain centers in the middle of the United States and the Atlantic seaboard ports. Though meat and cattle special trains have been in operation for several years the "Flour Special" is something new, although not unexpected when the growth of the country and its foreign trade are taken into consideration.

With the increasing magnitude of the milling business, the manufacturers found themselves called upon to solve the problem of insuring prompt deliveries to their customers. It was this condition that resulted in the special train service. Prior to this the millers had often sent out specials to fill "hurry" orders, but in recent months the demand for flour has been so steady and the "hurry" orders so numerous that the daily service was found to be a necessity. The plan has been so successful that it would be a difficult matter to find a miller willing to return to the old way of doing business.

The *Flour Trade News* in its last issue printed a picture of the train, which is composed of thirty-six cars loaded with 7,200 barrels of flour, valued at \$40,000. The freight paid on the shipment from Minneapolis to Buffalo was \$3,500, and as there is a train every day the weekly revenue to the railroad carrying the flour is about \$25,000. This special service obviates the necessity of the millers storing large quantities of flour in Atlantic coast warehouses to meet the demands of the trade.

Progress in Automobiles.—We have printed an account in a previous issue of the New York automobile show, but this paragraph in *Collier's Weekly* sums up the results so concisely that it is worth reading: "A million dollars' worth of motor vehicles was sold at New York's recent automobile show. The fourth annual automobile show, which was held at the Madison Square Garden, New York, was remarkable, not only on account of the diversity of the exhibits, but for the extraordinary number of knowing people who came to see them. The crowd that surged up and down the narrow aisles every afternoon and evening was made up to a great extent of the men and women who go to see and be seen at the Horse Show. In the case of this automobile show, they came not to be seen, but to see the legitimate exhibits only. Absolutely no effort was made to make the exhibition hall itself attractive and thus create a scene of beauty of which the automobiles form only a part. At the New York show every automobile had to stand on its own tires, as it were. Automobiles were there to be sold, and so great was the success of this dealers' exhibition that over one million dollars' worth of them were disposed of during the week."

Aspinwall Potato Machines

Make Large Profits Easy by Economizing in Time, Labor and Money.

We make a strong, practical and automatic machine for every stage of Potato Culture; in fact, the Aspinwall is the only complete potato implement line in the world.

With Our Machines seed is quickly cut to best advantage. Planting, fertilizing and covering are accomplished at any depth and width of row desired. Spraying is effectively done for bugs and blight. Digging and sorting are made pleasant and agreeable work by our time and labor saving machines.

Our catalogue, illustrating and describing the various styles of

ASPINWALL POTATO

Planters, Cutters, Sprayers, Diggers and Sorters made by us, mailed postpaid.

Traveling Cranes.

Patch Electric Floor Surfer and Polisher.

The Patch Electric Floor Surfer and Polisher is a device to dispense with the labor usually employed in dragging heavy weights over tile and mosaic floors to produce an even surface. It is also serviceable for polishing large granite and marble surfaces, and sanding wooden floors. The motor is 2-horsepower and will be furnished any voltage required. The voltage required should be particularly mentioned when ordering. The surface wheel is 20 inches in diameter. The sand box and water tank are conveniently located, supplying either sand or water as desired. The truck wheels have a heavy rubber tire, thus preventing marring the surface. The machine is shipped ready for immediate use. Gross weight, crated, 900 pounds. Net weight, 800 pounds.

The Burt Exhaust Head Realizes the Highest Expectations.

"The Burt Exhaust Head has fully come up to our expectations. These expectations were very high, and the work to be done in saving fuel, stopping waste and preventing a nuisance by reducing the noise of exhaust was more, really, than we expected the head to do, but it has accomplished it to our complete satisfaction. Thanking you for calling our attention to this valuable addition and help to our plant, we are,
"Yours very truly,
"SELMA (ALA.) WATER CO."

The water and oil that issue from the exhaust pipe disfigure, rot and rust the roof or walls of your plant. The Burt Exhaust Head allows nothing but absolutely dry steam to escape, thus it saves many dollars for repairs. The Burt Exhaust Head is the most reliable, the safest and most efficient head made.

The Burt Mfg. Co., 217 Main Street,
Akron, Ohio, U. S. A.
Largest Manufacturers of OIL FILTERS in the World.
Supplied also by Engine Builders, Dealers and Power Contractors.

CHANGES IN SAFE INDUSTRY.

Fireproof Receptacles That Are Really Fireproof and Other Recent Innovations.

AMERICAN manufacturers of safes came out with flying colors from the ordeal through which their products passed in the big Baltimore fire, demonstrating their superior merit in every way. The industry has always been an important one in America, but it has undergone many changes in recent years.

"The Baltimore fire has given as severe a test as could be desired of the safe and the safe-deposit vault that has been brought to perfection within the last ten years," said the manager of one of the largest safe manufacturing firms in New York a few days ago. "At the time of the Chicago fire there was nothing like them in existence. The modern safe is as much of an improvement over those in use then as the modern battleship is over those in use during the war of 1862.

"Fires in one part of the country and another are gradually taking the old-fashioned safe out of existence, and manufacturers are not putting others on the market to take their places. There is no denying the fact that cheap safes are made. Some of them look handsome in an office, but they are no more protection against fire than so much wood.

"Manufacturers used to aim to make a safe that was both burglar-proof and fireproof. They do not do that now. A fireproof safe—that is, a safe that will absolutely preserve its contents in a fire—is of very different construction from a burglar-proof safe. The perfect system of night watchmen in American office buildings and banks has reduced the demand for burglar-proof safes. Any burglar who touches a safe nowadays or gets anywhere near the door of a safe-deposit vault is likely to set off an electric alarm system that will bring the police or an armed guard upon him before he can get away. We have not had a bank burglary of any account in New York for twenty years.

"In constructing fireproof safes for offices in the skyscraper buildings we have to look out for danger from falls as well as destruction from fire. That is where the modern safe has stood the supreme test in the Baltimore fire. One of our safes, weighing 6,000 pounds, fell nine stories and is barely dented. Not long ago one of the modern safes fell twelve stories down the elevator shaft of a New York skyscraper. It cost \$1,200 to repair the elevator shaft and only \$26 to repair the safe. Some of the old-time safes were built of small iron plates—scrap iron, it might almost be called—riveted together at the corners. They might keep the fire out all right, but in a fall they went to pieces.

"The modern safe is a solid, one-piece angle frame, front and back, which cannot fall apart. It has eight flanges, compared with four in the old safes. The bolt-work and lock is away back of the fireproof filling, and not on the edges of the door, as formerly. The fireproof filling in the flanges or steps is of asbestos, marble dust and chemicals. Each manufacturer uses his own composition of chemicals, and keeps it a secret. The chemicals generate steam during a fire, which not only assists in preserving the contents of a safe, but reduces the chances of metal expansion.

"It follows, naturally, that safes are more expensive than they were. A business man does not hesitate now to spend from \$1,000 to \$5,000 on his safe. When you get far above the last-named price you get into vault work, which is a separate branch of the business. Safety vaults usually are built in conjunction with the construction of the building. The safes in them are designed by experts. They cost all the way from \$10,000 to \$300,000, which is the price of the vault in the First National Bank in Chicago.

"Steel is used in the construction of a safe whenever possible. For reasons not necessary to explain it is not always possible. Armor plate is not much good for safes. It is too expensive and does not work easily. We get the best results from a material manufactured for the purpose called chrome. Business men are buying more safes than they used to, because no man carrying a mercantile stock can get a fire insurance policy unless he keeps his books in a fireproof safe during the night, or in hours when they are not in use for business. Burglar-proof safes are still made for smaller towns or rural districts where the system of police supervision, night watchmen and burglar alarms is not so perfect as in New York."

Most Powerful Screwdriver in the World.

WHAT is undoubtedly the most powerful screwdriver in the world has come into existence through the necessity for something of the kind growing out of the needs of the engineering forces that are to build new tunnels to connect New York City with its vicinity. The carpenter in using the ordinary screwdrivers exerts a power of about 30 pounds. The new screwdriver will have a power of 200,000 pounds, equal to that exerted by 6,666 carpenters. They will drive the great piles which must be sunk under the tunnel; they will, in fact, be the piles themselves. Inasmuch as about 1,000,000,000 pounds of metal will be used in the tubes, a faint idea of what the piles will have over them can be formed.

The screwdriver piles to be used in the rivers washing New York's wharves are cylinders 2½ feet in diameter, made of cast iron 1½ inches thick. They will be located every 15 feet centrally, so that both tubes will be reinforced. They will be made in lengths short enough to be handled in the tunnel, the successive lengths being belted on as the pile sinks. The screwdriver, or screwpoint so called, is at the end of the pile and is so constructed

that it will have one turn to 21 inches and a diameter of 4½ feet. Ten years ago a person suggesting such a powerful screwdriver would have been considered a dreamer. Now it is accepted as a matter of course. All of which shows the progress of American inventive genius.

Advantages of American Vapor Engines.

GAS and hot air engines are coming more and more into vogue in America than they ever have before, although they have been popular since they came into trade. Some features of these useful and economical products of American inventive skill are given in a recent issue of the *Iron Age*, which tells how the gas engine is being installed in a great many small shops which formerly used steam as motive power, and this with very high-priced gas—\$1.25 per thousand feet. Whatever the particular reason may be, the gas engine is doing the work in the small shops that steam did and with entire satisfaction and marked economy. Its mechanism is simpler than that of the steam engine and is readily comprehended in its management by persons of ordinary intelligence. Says the *Iron Age*:

"The economy of gas engines varies greatly, being governed wholly by the price of gas. With natural gas at 10 cents per thousand feet, producer gas at 50 cents and illuminating gas at whatever companies choose to sell it for, gas engines are still much cheaper to run than steam engines, and there is no question but that they are making great inroads on the small engine and boiler business. It is said to be possible to get one horse-power from one pound of coal reduced to gas, but steam engines are doing well when they produce one horse-power from three times that amount of coal. The gas engine of the future, however, will materially reduce the consumption of coal, or gas, which is the same thing, for there are material losses in it, due to phenomena not yet fully understood."

Gas and hot air engines are not expected to displace steam engines by any means, but for many purposes they are much more satisfactory to the purchasers. We print the *Iron Age's* opinion upon the subject as a matter of information to which are readers are entitled. We do think that for some purposes the value of gas and hot air engines is not fully appreciated either at home or abroad. It is a fact that the demand for them has been increasing to an extent that is gratifying to the manufacturers, but the simplicity of operation of these motors, their comparative cheapness and their adaptability to so many conditions which are met with by small power users everywhere in the world seems to call for some mention of the merits of this branch of American production for the export trade.

New Phases of the Turbine Engine Discussion

STEAM turbines continue to be a leading topic for discussion in American trade newspapers. The *American Inventor*, which closely watches progress made in the inventive world, has this to say about the new motive agency: "Among the greatest advantages of the steam turbine engine is the saving of heat, which, of course, means coal; but it means also a cooler engine-room, and this, in turn, cooler cabins. A steam turbine can be almost perfectly insulated; there are but a few bearings, and they should be of the roller types. The thrust bearing, too, should be a roller bearing. It is an unsafe prediction for any one to say that certain machinery has reached its limit of efficiency, but we are probably pretty nearly correct in not expecting much further improvement in a crank engine. There is a limit to a piston speed, especially as we increase the weight of the moving parts, with many wearing surfaces, and high centers with cylinders well above the water line. These defects and many more are covered by the turbine.

"The fact that one of the large shipbuilding companies in the United States offered to equip a naval cruiser with turbines is suggestive. The few bearings that a turbine would have would be rollers, and the efficiency of a motor with but few wearing surfaces, and these of such an anti-friction kind as rollers, ought to be benefits of no mean order. The turbines would have no surface to adjust, no wear of any account, could be well balanced, and would work as economically, if not more so, in point of fuel, as a reciprocating engine."

Built Seven Locomotives in a Day.

WORKING on a rush order from the Japanese Government for locomotives, a big plant in Philadelphia, U. S. A., has established a new record by the construction of seven locomotives in a day. The engines were ordered by Japan for the military railroad to connect Fusan, on the southern coast of Korea, with Seoul, the capital. The line will be about 225 miles long.

The order, which called for twenty locomotives to be completed within thirty days, was received late in January. Six engines went overland to San Francisco, and thence by steamship for Fusan, while the remaining engines went by the all-water route from New York by way of the Suez Canal, all being shipped within the contract time.

American Typewriters in Greater Demand Abroad.—George Macmillan Cassatt, of London, was at the Netherland Hotel, in New York recently. Mr. Cassatt, who is resident director of the Remington Typewriter Company, in Europe, is a native of Ohio. "The demand for typewriters in Europe," said Mr. Cassatt, "is yet ten years behind the United States, and, though the market has been greatly expanded in the last ten years, it is still smaller than that of the United States."

CARY'S UNIVERSAL BOX STRAPPING

Made of soft steel through which nails can be easily driven.

Put up in coils of 300 feet and packed 20 coils in a case.

Patented
in All
Countries.

Made in four widths, viz.:
 $\frac{1}{2}$, $\frac{5}{8}$, $\frac{3}{4}$ and 1 inch.

BINGHAMTON · NEW YORK · U.S.A.

Sleeping Cars on Electric Trolley Roads.

WE have given accounts in previous issues of the development of the trolley-car service in suburban districts in the United States with reference to the replacement of steam locomotives and trains by electric cars, mentioning incidentally that sleeping-cars were a new idea in the competition that had arisen between steam and electric railroads. The New York *Tribune* prints a very interesting article on the subject, showing the development of the country and describing the innovation. The *Tribune's* article repeats some information given to our readers in previous issues, but there is an amplification of some of the subjects that makes it worth repeating. The *Tribune* says substantially what follows below:

For some time it has been possible to make trips by trolley between cities separated by hundreds of miles, and in the Middle West, in the United States, the trolley lines have entered into the business of transporting freight, produce and baggage, and now in the same region where the development of the trolley car has been greatest, the innovation of the trolley sleeper is about to be tried. This service will be put into operation at an early date between the cities of Indianapolis and Columbus. It is designed to have two of these cars moving between the cities named, one making the trip by day as a parlor car and returning at night as a sleeper.

In its exterior appearance the car is much the same as the standard American railroad coach of this character. Its operation on the road will be identical with that of the railroad sleeper, much the same arrangement having been made between the electric company and the palace car company which built these cars and which will own and control them. The latter company charges the electric company with mileage at an agreed rate and the electric company will collect its own regular fare and also an extra charge for the extra service rendered. The rate for a lower berth between Indianapolis and Columbus is to be \$2, and for the upper berth \$1 will be charged. This is about the same rate as is charged by the steam lines between the cities named for the same service, but the saving to the passenger in this case is the difference in the regular fare. Between these two points the round trip can be made on the trolley for the same cost as a passage one way on the railroad.

Except for the length of the car and the presence of a trolley pole on top, the outward appearance of the trolley sleeper is much the same as the ordinary sleeping-car. It is inside the car that the most radical departures from the old design of sleeping-car construction have been made, and yet in a great many respects the interior has much the same appearance as any American sleeping-car.

The most striking innovation is the fact that each section, when made up for the night, comprises a tiny room, so that a passenger may have in a measure the comforts and privacy of a room at a hotel or at home. When the occupants of a section have agreed that they are ready to retire the porter unlocks the backs of the two chairs of the section and stretches them out in such a manner that the two form one bed extending along the wall of the car. One of the chair handles is removed entirely and laid away until wanted again, and the other is dropped into a horizontal position, where it helps to support the bedding. After some further manipulations this forms the lower berth. Some wooden posts which have been brought from a locker at one end of the car serve as supports for a flexible wooden partition much like that of the roll-top desk. This roll is stored between the real and the false floor of the car and is finished with a covering of some fabric of attractive design. These curtains are operated on spring rollers, and the recess in which they repose when not in service is hidden by a metal plate, which is removed by the porter when he desires to draw them into place. Four of these curtains are required to enclose three sides of the room, the fourth side being the wall of the car. There is one curtain at each end and two on the side of the section toward the aisle. This is to permit of a door in the middle of the room, and this is shielded by a heavy drapery, which is hung after the section is made up.

The top berth is made up in the same manner as that in the usual railroad car, and, like the latter, also contains the bed clothing for the entire section. While it is true that there is not a great amount of space at the disposal of the occupants of this room, the arrangement has certainly many advantages over the simple curtain of the Pullman and Wagner cars. The room, though small, affords a privacy which will be appreciated by women and many men who are compelled to travel by night. This scheme also protects the ear of the sleeping passengers from a great deal of the outside noises which are experienced in or near the cars. The matter of ventilation is looked after in these little apartments by leaving a small opening at the bottom, and there is sufficient outlet at the top through the grillwork which supports the tops of the removable posts to permit a constant circulation through the section.

The car is a trifle over 48 feet long and a trifle less than 9 feet wide. It is supplied with vestibules and has a smoking-room, wash rooms and other conveniences. The main room is 32 feet long, and at night makes up into ten compartments, each one almost 7 feet in length. The interior is elegantly furnished in inlaid mahogany, and a generous supply of mirrors is worked into the decoration of the car in order to facilitate the matter of toilet-making.

In order to deaden the noise of the passage of the car over the rails the framework is lined with mineral wood. The trucks of these cars resemble, in their proportions, those designed for regular railroad work. Each truck has four wheels and each axle is fitted with a 150-horse-power motor, making a total of 600 horse-power for the entire car.

The Passing of the Steam Fire-Engine.

ONE of the signs of progress in America has been the constant improvement in fire-engines with which to fight fires, but as these machines reach a marvelous degree of efficiency a new era in the use of power to fight fires has begun. The recent completion of a powerful pumping plant and a system of independent high-pressure fire mains in the city of Philadelphia to take the place of horse or motor-driven steam fire-engines is also noteworthy in this connection as indicating the tendency toward centralization in modern mechanical engineering practice. While it may be too much to say that it marks the beginning of the disappearance of the fire-engine in large cities, nevertheless, it seems quite clear that such a plant can furnish more effective protection to a given area, and that, aside from its initial cost, it is less expensive to maintain. The advantage to the citizens is shown by the fact that for the district in the city of Philadelphia protected by the new plant insurance rates have been decreased 15 cents per \$100, and with the increased efficiency of the system a further decrease of 10 cents is promised.

In outline the new pumping system may be described briefly as follows: It consists of a number of powerful pumps driven by gas engines and located in a single building 72 by 140 feet, and using an independent and never-failing supply of water derived from the Delaware River. This is distributed under high pressure through a network of specially constructed mains, aggregating some nine miles in length, over the selected territory which includes about 425 acres. The hose is attached directly to hydrants of a special pattern, and it is possible to send four streams to the top of the highest skyscraper in Philadelphia. The plant is said to take the place of more than forty fire-engines, and the pressure furnished and consequent efficiency is far beyond that of ordinary fire-engines.

Latest Innovation in Farm Machinery.

INNOVATIONS of interest in the line of farming machinery are constantly appearing, and we are indebted to *Hardware* for some account of one of the latest ones: Not many years ago the farmer was compelled to plant all his seed by hand, walking many miles and carrying heavy burdens to sow the grains or plant the potatoes which were to yield the harvest in the fall, and even the grass had to be cut with scythes. Now all this labor is performed by machinery, while the farmer rides over the ground, guiding his team, and accomplishing more in a single day than he could in a week before the inventor set out to aid him in his toil. Still another machine has been brought forward, this time a weed-puller, invented by a man in Minnesota, U. S. A. In regard to the mechanism by which it is operated, two fluted rollers are mounted on an adjustable support at the rear of a sulky, with chain gearing to rotate them rapidly as the machine is drawn over the ground. As the flutings on the face of the rollers mesh closely together, it is easy to understand how any weed or grass which once gets between them will be drawn up, until it is finally lifted out of the ground, roots and all. To insure the killing of higher growths, the machine has been fitted with a series of rotary blades, which feed the tops of the weeds down beneath the face of the first roller, instead of allowing this roller to strike the stems and push the weeds over without uprooting them.

Progress of American Steel Manufacture.

DURING the last ten years much progress has been made in America in the use of stamped steel for the manufacture of various small articles, such as scales, coal-hods and various metal articles for household and industrial use. The chief advance has been in the improvement of stamping machinery, but the steelmakers have also accomplished a great deal by producing rolled steel that can stand as severe bending and stamping tests as the best brass. This has made possible a great deal of delicate and difficult stamping work that could not before be attempted. A few years ago cast iron was largely used for many small articles that are now made almost exclusively from pressed or stamped steel. New pressed steel hods are made that are far lighter and more durable than those formerly placed on the market and more serviceable. They are pressed out of a single piece of metal, which also enhances their durability. Of course, the machinery for stamping sheet steel is much more expensive than the equipment necessary to mold and finish castings, but the work is done so much more rapidly, and the parts when finished are so much stronger and lighter and more durable and accurate that there is a net gain not only in manufacturing cost, but a great gain in the character of the finished product. The saving in freight and expressage is also very considerable.

Labor Saving Machinery.—The *Wood Worker* prints the following: "A New York City daily recently printed an item from a correspondent to the effect that G. W. Younger, of California, U. S. A., has invented and put in operation a compressed air cross-cut sawing apparatus which, with a gang of seven operators, falls and cuts into log lengths as much timber as formerly required twenty-five men. The saws make 150 strokes per minute and a tree 5 feet in diameter is cut off in five minutes. The apparatus is said to be in use in the Mount Shasta country."

American Mowers for Russia.—In one week last month there were exported from America fifty carloads of mowers for the Russian markets, and this was only part of the order from that country.

ESSEX'S STANDARD STEAM-ENGINE LUBRICATORS.

Essex "Pilot"
Snap Lever, Sight Feed
Glass Oil Cup.

"Simplicity Is the Essence
of Durability and Economy."

Such are the ESSEX LUBRICATORS, having few parts (none complicated), made by skilled mechanics, of the best material obtainable; and each lubricator thoroughly tested before leaving our factory.

OUR 1904 CATALOGUE, illustrating and describing the many styles of LUBRICATORS made by us, mailed postpaid to all parts of the world.

We carry a large stock and make Quick Delivery.

Ninety per cent. of automobile makers in the United States of America use exclusively the Essex Automobile Lubricators.

NEW TELEPHONE TESTS.

Conversation Between New York and London May Soon Be Possible by American Invention.

AMERICAN telephone companies, with headquarters in New York, are making tests, with a view to making improvements in the present telephone system, of the invention of Prof. Michael I. Pupin, of Columbia College, U. S. A. They have established lines in accordance with Professor Pupin's system, and already many satisfactory results have been determined. By placing coils wound on wire at regular intervals on a circuit, Professor Pupin found that the current was transmitted without interference of waves or loss of current. To apply this discovery practically the New York Telephone Company has installed an underground cable to Kingsbridge, the New York and New Jersey Company is experimenting with an underground line between New York City and Elizabeth, and two lines on Long Island, and the American Telephone and Telegraph Company is testing overhead Pupin lines to Omaha, St. Paul and Boston—much more distant points.

The first practical application was the laying of the cable to Kingsbridge, which the New York Telephone Company has just completed at an expense of \$200,000. Some of the wires are in use now, and have satisfactorily accomplished the results expected.

"The purpose of this Kingsbridge cable," said Chief Engineer J. J. Carty recently, "is to enable us to carry a long-distance wire, like the Chicago wire, into the city underground. By the old system conversation over a long-distance wire like that, if carried underground for that distance, fifteen miles, would be impossible. One mile underground has as much cutting down effect on a wire as 28 miles overhead, so ordinarily a 15-mile underground stretch at each end of a wire between here and Chicago would equal 840 miles overhead, or practically the whole distance between the two cities.

"In the new system the wire coils are placed at intervals of two miles on each circuit, and by the action of peculiar electrical laws, with the operation of which even engineers are unfamiliar, the current is transmitted without the usual interference. For this reason we hope to conform to the sentiment of the people of this city in regard to overhead wires by doing away with our present long-distance pole lines, which we will do if the experiment proves a commercial success. The final test is yet to be made, but so far the results have been very satisfactory."

The American Telephone and Telegraph Company has applied Professor Pupin's ideas to its long-distance overhead lines, and now has been experimenting with them for more than a year. The results have been generally satisfactory, but some minor difficulties, for example, the effect of lightning on the Pupin wires, have been encountered.

Professor Pupin expects that his new system will revolutionize the construction of telegraph cables and make possible telephone communication between this city and London. Heretofore what is known as the "resistance" of the cable has made telephoning across the ocean an impossibility. Even in ocean telegraphy, if the speed of transmission is accelerated beyond a certain point, the sounds are confused at the other end of the wire on account of this resistance. It was toward the overcoming of this resistance that Professor Pupin spent several years of study, research and experiment.

Will Use American Signaling System.

LONDON'S Underground Electric Railways Company, Limited, which concern, under the presidency of Charles T. Yerkes, is building extensive underground and surface electric traction lines in and around the British metropolis, has decided to use an American system of signaling on the fifteen miles of double track of the Metropolitan District Railway, and has given the contract for this work to the Westinghouse interests. The signals for this system, which will be the first electric road in Great Britain to employ such, will be operated by the electro-pneumatic method, and will be 300 in number, the service in the tunnels being arranged for trains running at intervals of about 1½ minutes. A new form of combined signal motor and arm will be employed.

American interests have secured practically all the contracts for the equipments, etc., of the Yerkes system. The power house at Chelsea, London, S. W., will have Westinghouse equipment. This plant will be the largest of its kind in the world and will cost upward of \$6,000,000. The motors in the cars for the complete system of some 140 miles will also be supplied by American interests, the British Thomson-Houston Company, Limited, which is controlled by the General Electric Company, of New York, having taken the contract, which calls for motors aggregating 500 horse-power for each of the 480 cars, and representing an expenditure of some \$7,000,000.

Our Electric Machinery for Australia.—The Westinghouse interests have secured a contract through their Australasian representatives for a 5,000-volt alternator of the rotating field type for direct connected exciter. The machinery is to be installed in the Dunedin (New Zealand) corporation electrical power plant.

American Fans for China.—An American concern has recently secured a large contract for the shipment of alternating current electric ceiling fans to China.

Pan-American Railway Lacks 4,800 Miles.

A LITTLE over a year ago we announced the departure of Charles M. Pepper, who then started on a trip as a United States commissioner in the interests of the proposed great Pan-American Railway Commission. Commissioner Pepper has just returned. He visited fourteen countries and spent a year in his work. He thinks that it will not be many years before a through railroad journey may be taken from New York to Panama and from Buenos Ayres to Lima. He says that 4,800 miles are lacking to complete a through railway line from New York to Buenos Ayres, and the labor cost of this construction he places at \$150,000,000. He says that action by Mexico on the north to extend its lines south to the border of Guatemala was taken about the same time that the Argentine Republic put in force measures prolonging its railway system to Bolivia. Only 172 miles of line are lacking to connect the Isthmus of Tehuantepec with Ayutla on the border of Guatemala, and a section of thirty miles has to be built in the latter country to make through connection with the capital. Actual work is in progress on the Mexican section. In the Argentine Republic the Government is building the line from Jujuy to Tupiza, in Bolivia, under a treaty with that country.

The Panama Canal is given as one of the favorable factors toward railway development. The moral influence of the control of the United States, Commissioner Pepper declares, will be very beneficial. Besides this the overflow of private capital will encourage railway enterprises both to meet the demand for supplies on the isthmus, and to provide for the international traffic during the period of construction work on the canal.

Commissioner Pepper discusses markets and trade and opportunities for American commerce, both as the result of railway extension and as a consequence of the permanent demand which may be created. He gives numerous instances of the preference for rolling stock from the United States, especially for locomotives. He says that the mills of this country can compete with Europe in supplying steel rails, and that bridges can be built for South America as profitably as for Egypt.

Wonderful Work of Our Veneering Machines.

VENEERING in America has largely increased in the last few years, and a writer in the *Woodworker* gives some interesting facts about the growth of the trade. Owing to the rapid consumption of the more valuable woods, such as black walnut, bird's-eye maple, curly birch, mahogany, etc., it has been found necessary to economize; and where, in years gone by, these woods were freely used in the solid, they are now generally veneered in thin sheets running from 10 to 12 to the inch to as thin as 140 to the inch. In cutting as thin as this it becomes necessary to use a knife that is keen as a razor, perfectly straight and uniformly tempered without any irregular spots—some too soft, causing the edge to dull quickly, and in dragging over the surface of the wood leaving a rough and uneven surface, or so hard that the edge will not stand the hard work required of it and crumble or chip out in cutting through knots and hard places. This is particularly true in cutting mahogany and other woods with long knives, on what are known as the slicer machines. As these woods, owing to their value, are cut thin, they cannot be cut with anything but a perfect knife, that will not mar or scratch the fine surface, and in this respect American mechanics have succeeded in producing the proper tools to do the work.

New Dangerless System of Electric Traction.

A NEW surface electric contact transportation system was tested at Atlantic City, U. S. A., recently on a mile track on the Pennsylvania Railroad, in the presence of a large number of electricians and railroad men. This system of car propulsion does away with the third rail, overhead wires, poles, open conduits, cables and storage batteries, and is called a wire-less system. It is declared that under it the cost of maintenance is one-fourth that of any other system. An especially large open trolley car was used for the experiment and more than one hundred persons were crowded in it. Beneath the car is a series of magnets, which make the contact as the car passes over the boxes, which are in the center of the track, 16 feet apart. In appearance the contacts are like inverted saucers. They are on the surface of the street, but do not in the least impede travel. The contacts are alive only at the time of the passage of the car over them. When the magnets pass over the contacts they fly upward, making the contact in a flash. It is claimed that a speed of eighty miles an hour can be attained with no loss of current.

American Motor Cars Becoming Popular Abroad.—Recent compilations of the United States Government show that in one month of the current fiscal year the exports of automobiles and parts thereof increased from \$55,473 in the previous year to \$107,521. Other figures, confirming those mentioned, make it plain that American automobiles are finding favor in foreign countries, and the wonderful strides American manufacturers are making in the development of the automobile industry tend to the belief that in the next year or two American automobiles will be found in every civilized country on the globe.

American Device Adopted.—The London *Morning Post* has adopted an American system for the electric operation and speed control of its printing presses.

Knock-Down Office and Home Furniture for Export. The "GUNN" K. D. Sectional Bookcases.

A FEW REASONS WHY THE "GUNN" K. D. SECTIONAL BOOKCASES ADMIT OF DIRECT IMPORTATION TO THE TRADE.

The assortment is SMALL. All parts are INTERCHANGEABLE, making every possible size bookcase from the same stock. They require but little space in warehouses, as the cases are shipped K. D. (flat) and can be set up as required, with no tools but the hands.

Our method of boxing K. D. (flat) insures arrival of goods in PERFECT CONDITION, as NO POSSIBLE DAMAGE CAN OCCUR TO FINISH AND NONE OF THE PARTS CAN SWELL OR WARP, as in ordinary furniture. Deliveries can be made in thirty days, and by using our special code, twenty days.

ADVANTAGES OF THE LINE.

The field to sell is very large, as the same stock meets the demand from offices and public buildings, as well as for home use—in fact, anywhere an article is desired to be covered from dust and moisture. Each sale made is a guarantee of repeated purchases for additional sections, as books accumulate. The sections can be added, vertically or horizontally, to fit the wall and space. The glass doors, when raised, disappear, sliding on small frictionless roller bearings. The "GUNN" is the only case in which a broken glass can be replaced by simply taking off the door, and without removing the books or taking the case apart. The cases, when set up, present a handsome appearance, with no objectionable features, and are as rigid as an ordinary bookcase.

We GUARANTEE the "GUNN" SECTIONAL BOOKCASES PERFECT IN ALL RESPECTS.

Special Offer for Export Only:

The prices here quoted (U. S. gold or its equivalent) include boxing for steamer, and delivered f. o. b. cars at New York City.

THREE-SECTION CASE, as shown, complete - - - each \$10.76
SIX-SECTION CASE, as shown, complete - - - each \$17.98

IMPORTANT NOTICE.—To secure full benefit of above, even sample orders should not be for less than the steamship minimum for issuing ocean bills of Lading. Some steamship companies accept not less than 40 cubic feet, while others not less than 80 cubic feet. Six Three-section Cases occupy 40 cubic feet; Four Six-section Cases occupy 40 cubic feet. NOTE explanation of ocean freight on "Gunn" K. D. Cases: "An ocean rate of 10 shillings per 40 cubic feet equals a cost of eight cents per section, or about four per cent. on the cost boxed f. o. b. New York."

Specify "Gunn" when ordering. Orders received direct or through export houses. When ordering through the latter, to avoid errors, please mail us duplicate of order. Our catalogue, illustrating and describing the various styles of Sectional Bookcases and Filing Cabinets made by us, mailed postpaid.

THE GUNN FURNITURE CO., Grand Rapids, U. S. A.

Western Union and A. B. C. Codes used.

Cable Address: "GUNN," Grand Rapids.

We also make a full line of Roll and Flat Top Office Desks and Typewriter Cabinets.

"Gunn" K. D. Sectional Bookcase.

This cut shows our knock-down (flat) construction. It is put together without nails or screws, or dowel-pins; the irons that are fastened to the shelves have upper and lower tongues that fit in the grooves in the bases, center sections and top sections, thereby binding all rigidly together.

Future of Our Trade with China.

A BIG dinner was recently given in New York City, at which Sir Chentung Liang-Cheng, the Chinese Minister to the United States, talked about "The Gorgeous East." The diners cheered and cheered for the diplomat. He prophesied a great future for the trade between the United States and his country. He said in part:

"Ever since the discovery of the ocean routes to the East the efforts of the West have been directed toward shortening those routes. With this end in view, the Suez Canal was dug. The demands of commerce and civilization have long rendered an interoceanic canal across the American isthmus a positive necessity. The logic of events is such that the building of such a canal may now be looked upon as one of the undertakings sure to be carried out in the near future."

"One of the most obvious results of cutting a canal across the American isthmus is to bring the East and the West, especially America, into closer relations. The cities on the Gulf coast and the Atlantic seaboard will find themselves thousands of miles nearer than they are now to Shanghai and Yokohama. Trade and commerce cannot but feel the effect of this shortening of distance. Upon the opening of China as a market for American goods will depend, in a great measure, the future commercial expansion of the United States."

"It must be remembered that all the nations of Europe are active competitors of the United States in almost all those lines of goods which American manufacturers have to offer. At the same time the tariff walls which each country has erected for the protection of home industries are growing higher and higher every day. Trade, like everything else, follows the line of the least resistance, and the line of resistance for American trade lies evidently in the direction of China."

"It is not necessary for me to go into details regarding the Chinese market for American goods. Suffice it to say that the trade in wheat flour and cotton goods alone is susceptible of indefinite increase. The demand for American wheat flour in China first attracted attention shortly after the Boxer trouble. Now China imports several million dollars worth of it every year."

"The industrial development of certain parts of the United States is vitally affected by the progress of events in China. Thus, the 'open-door' policy so strenuously championed by Secretary Hay under the administration of President McKinley and President Roosevelt is dictated, not only by a benevolent desire to help China, but also by an enlightened self-interest."

Our Manufactures Are Liked in Chile.

CHILE'S trade with the United States is increasing. R. E. Mansfield, the American Consul at Valparaiso, in a recently published report says in part: "The value of the imports into Chile from the United States greatly exceeds Chilean exports to the United States. In the eight years from 1895 to 1902, inclusive, Chile imported from the United States merchandise to the value of \$34,287,648, while Chilean exports to the United States during the same period amounted to only \$22,820,832, a balance of trade in favor of the United States of \$11,466,816 in the eight years, or an annual balance of \$1,433,352."

"Machinery of various kinds, including agricultural implements, forms an important item in the import trade of Chile, a large part of which comes from the United States. The total value of farm machinery and agricultural implements imported into Chile in 1902 was \$635,845, of which the imports from the United States amounted to \$329,361. All the machinery imported during the year amounted to \$2,324,446, of which \$1,062,490 represented the imports from the United States."

Growth of Our Export Trade in a Nutshell.

CONSIDERING the commerce of the United States for 1903 by grand divisions, that with Europe is, of course, first in order of magnitude, both as to imports and exports. Our exports to Europe grew from \$680,000,000 in 1893 to \$1,087,000,000 in 1903. To the countries of North America our exports increased from \$125,000,000 in 1893 to \$227,000,000 in 1903. To South America our exports grew from \$34,000,000 in 1893 to \$46,000,000 in 1903. To Asia our exports grew from \$20,000,000 in 1893 to \$55,000,000 in 1903. To Africa our exports increased from \$5,000,000 in 1893 to \$31,000,000 in 1903.

In the commerce with Oceania the figures are, on their face, misleading, because they do not now include the figures with Hawaii as they did a decade ago. The figures on their face show exports to Oceania as \$11,000,000 in 1893 and \$37,000,000 in 1903; but if our shipments to Hawaii in 1903 were included in the statements of foreign commerce the total would be about \$50,000,000.

Our Exports to Canada.—Canada stands third in the order of magnitude of exports from the United States. Our total exports to Canada in 1893 were \$57,000,000, and in 1903, \$131,000,000.

America's Trade with France.—France is fourth in the magnitude of its commerce with the United States, our exports to that country in 1903 being \$88,000,000, against \$57,000,000 in 1893.

Netherlands Likes Our Goods.—Exports from the United States to the Netherlands in 1903 amounted to \$73,000,000, against \$43,000,000 in 1893.

British Empire Is Our Best Customer.

MORE than one-half of the exports from the United States in 1903 went to British territory, and practically one-third of the imports into the United States came from British territory. Our total exports to British territory in the calendar year 1903 were \$768,000,000, or 52 per cent. of our total exports, and our total imports from British territory \$308,000,000, or 31 per cent. of the total, speaking in round terms. These facts are shown by an analysis of the year's commerce made by the Department of Commerce. By British territory is meant the United Kingdom and its colonies, dependencies and protectorates.

The territory included under this designation of the United Kingdom and its colonies, dependencies and protectorates contains over 11,000,000 square miles, or more than one-fifth of the land surface of the globe, and has a population of 400,000,000, or one-fourth of the population of the world. The largest exportation to British territory, of course, was to the United Kingdom—\$43,000,000—and this was the largest exportation to any single country. Next in order of magnitude of exports to British territory was Canada, \$131,000,000; British Australasia, \$32,000,000; British Africa, \$28,000,000; British West Indies, \$10,000,000; Hong Kong, nearly \$10,000,000; India, nearly \$5,000,000, and the remainder scattered through the smaller British dependencies.

Big Demand for Our Products Abroad.

EXPORTS of American manufacturers in January and in the seven months ending with January show a larger total than ever before in the same portions of the year. For the month of January they amounted to \$38,213,352; while the highest January record on any former occasion was that of 1900, when they were \$35,586,940. For the seven months ending with January they amounted to \$250,214,936, and the highest record for that seven months' period in any preceding year was that ending with January, 1901, when the total was \$239,564,064. Thus the total for January is \$2,500,000 in excess of any preceding January, and for the seven months ending with January is about \$11,000,000 more than in any preceding seven months ending with January. These figures are shown by analysis of the January exports just prepared by the Department of Commerce.

This increase of \$20,000,000 in exports of manufactures in the seven months ending with January, as compared with the corresponding seven months of last year, is distributed among most of the leading classes of manufactures exported. Agricultural implements show an increase in exports, amounting to a little over \$2,000,000 for the seven months ending with January, 1904, as compared with the corresponding months of last year, and about \$4,000,000 increase, as compared with the seven months ending with January, 1902.

Growth of Our Trade with Japan.

KIYOSHI SUGAWA, one of the Japanese commissioners to the American World's Fair, and a director in the Japan Exhibit Association, was in New York last month. "The war," said Mr. Sugawa, "will not make the slightest difference in the Japanese exhibit. Prospective exhibitors took the probability of war into account and made their plans accordingly. There are more than 2,000 exhibitors among the Japanese merchants and manufacturers, and they haven't been able to get space enough."

"The Japan Exhibit Association," said Mr. Sugawa, "has had applications for space to display 240,000 articles, while the room that has been allotted us will only permit of 70,000 exhibits. It has been necessary to appoint commissioners to decide who is to have more space and who less, and when I left Tokio on January 7th the offices of the Exhibit Association were being besieged by grievance committees from the local branches of the association from all over Japan. Each district was afraid it would not get its due."

Mr. Sugawa expects that great numbers of Japanese merchants and manufacturers will visit the United States during the summer.

"This country is one of our best customers," he remarked, "and we on the other hand are buying more and more from the United States each year. It is only natural that the commercial classes of Japan should take the keenest interest in everything here. Reciprocity with the United States is a national sentiment in Japan."

Our Exports to Russia Gained Last Year.—Exports from the United States to Russia in the year just ended aggregated practically \$20,000,000. This is more than double the amount of our exports to Russia in 1901, the year in which duties were advanced upon merchandise from the United States entering Russia, and is double the average for many years preceding that date. Imports from Russia have also greatly increased since that time. Comparing conditions in 1903 with these of 1901, it may be said that exports to Russia, as already indicated, show an increase of more than 100 per cent. Of agricultural implements the amounts were: 1901, \$1,692,597; 1903, \$3,636,145, showing even a greater increase than the general average.

Exports of Wire, Wire Nails and Pipe.—The demand abroad for our wire, wire nails and pipe continues, nearly 7,000 tons having been exported through New York and other Eastern seaboard points last month by the American Steel and Wire Company and National Tube Company, branches of the United States Steel Corporation.

MILLS NOVELTY CO.

INCORPORATED.

CAPITAL, \$500,000.00.

CHICAGO, U. S. A.

The Mills-Chicago.
With Music Box.
Weight, boxed for
shipment abroad,
about 340 lbs.

Mills Novelty Co.'s Works, Chicago, U. S. A.

Largest Manufacturers and Exporters
in the world of all kinds of

Coin-Operating Machines.

Our 80-page catalogue, just issued, profusely illustrated, in colors, describing the many styles of **Coin-Operating Machines** made by us, will be mailed post-paid to all parts of the world.

Nearly all our Coin-Operating Machines can be made to be operated by the coin of any realm.

All machines are boxed ready for steamer, and prices quoted will be f. o. b. cars New York or San Francisco. Orders received through export houses. When ordering through export houses specify MILLS NOVELTY CO.'s COIN-OPERATING MACHINES, and to avoid errors, please mail us duplicate of order.

EMBOSSED METAL CEILINGES, Side Walls and Center Pieces. LARGE AND COMPLETE LINE OF CLASSIFIED DESIGNS.

New Catalogue sent on request to those interested.
SPECIAL PRICES FOR EXPORT.

MONROE PORCELAIN REFRIGERATORS.

Monroe Refrigerator No. 21. Style D.

THE MONROE IS A HIGH-GRADE REFRIGERATOR, BUILT FOR THE HOUSEHOLD.

Each food compartment is moulded in one solid piece of porcelain. The corners are rounded. There are no joints or crevices for the food to decay in. The porcelain is white, durable, and as easily cleaned as a china dish. The ideal house refrigerator, absolutely sanitary. The prices here quoted for foreign markets only (U. S. gold or its equivalent) include crating, ready for transportation abroad, delivered f. o. b. at New York City.

MONROE No. 21, Style D, Solid Porcelain Inside, Oak Exterior, \$54.00

Crated, measures 49 x 27 x 47 inches. Gross weight, 630 lbs.

MONROE No. 30, Style E, Solid Porcelain Inside, Oak Exterior, \$69.00

Crated, measures 49 x 27 x 57 inches. Gross weight, 820 lbs.

All sizes carried in stock ready for immediate shipment. Special sizes built to order.

Our latest catalogue, illustrating and describing the various styles of Solid Porcelain Refrigerators made by us, mailed postpaid.

Orders received direct or through export commission houses. When ordering through the latter, to prevent errors, kindly mail us a duplicate of order.

LOCKLAND, OHIO, U. S. A.

LITTLE'S SATIN-FINISH CARBON.

LITTLE'S CARBONS will not dry out under any ordinary circumstances, in any climate. No Carbon made under any other process than Little's can give this guaranty, and there can be no imitation of Little's process in carbon making; attempts to steal it have resulted in permanent injunction; and contempt of Court is an untried way to business success.

Little's famous brands, "Cobweb" and "Satin Finish," are known and used all over the world.

Little's Carbon Papers are better than all others because: They do not smut. Impressions from them in many instances can hardly be told from those made by a ribbon. They are not sticky or greasy, yet they do not dry out and do not spoil with age, or in any climate. They last longer than any others. The color is denser, stronger, more permanent than any other. It is evenly spread by automatic machinery.

Most other Carbon Papers look alike. Little's looks different. It is different, being made differently by a special process, and it does different work. Send for Catalogue. Orders received through New York exporting houses at export rates.

Russia Orders American Submarine Boats.

WAR between Japan and Russia has interfered to some extent with certain branches of the export trade, but there have been increases in other directions. Russia, for instance, has just given a rush order for ten submarine boats to an American company. The contract specifies that the vessels must be delivered by the builders at whatever port the Russian Minister of Marine designates. If the vessels are delivered within eight months the builders get a bonus of \$750,000—\$75,000 on each boat. The greatest reticence is observed by the company in regard to this order, for the submarines would be liable to seizure by Japan and the difficulties of delivering them, particularly on the Asiatic coast, would be very great, for Japan would undoubtedly do everything possible to capture or destroy the boats even before they could reach the war zone. The vessels will be built in sections, to be put together at some point selected by Russia, but ships carrying the material would be subject to seizure by Japanese warships.

The agent who made the contract is quoted as saying that Russia had no expectation that there would be a war, or the contract would have been made over a year ago. The fact that the submarines are ordered on a quick-delivery basis of eight months indicates that Russia does not expect an early ending of the war.

If these boats are completed in time to take part in the naval struggle it will be the first test of their efficiency in actual warfare. Thus far submarines have been subjected merely to trial trips and certain maneuvers imposed by the Navy Department of this country and the French and British Admiralty. Their utility is largely a matter of conjecture. This much is known of them: They can dive and remain under water for from one to four hours. While under water the best searchlight in the navies of the world could not discover their presence. They also run in what is known as the "awash" position, which means that the waves are continually running over their all but submerged body. At night it would be practically impossible to pick them out. Their speed while under water is from three to four knots an hour, and while running in the exposed position they can make from eight to ten knots an hour. Each boat is equipped with two torpedo tubes and projectiles of the Whitehead variety, one of which is capable of destroying the largest battleship if delivered with precision.

It is probable that Admiral Dewey's views had something to do with Russia's selection of the submarine boat as an offset to Japan's equipment with the ordinary type of torpedo boats and torpedo-boat destroyers. Admiral Dewey, a few days ago, was quoted as having stated that if Japan had been supplied with submarine boats on the night of February 8th, when she made her attack on the Russian fleet, not a Russian ship in the harbor of Port Arthur could have escaped destruction. This at least shows that Admiral Dewey has faith in the submarine type, in spite of the fact that it never has received a test in actual war.

Ordinarily it requires ten months to build a submarine boat. By crowding the work it can be done in eight months, and by making extraordinary efforts it can be accomplished in six months. This means work both by night and by day. The castings and forgings for the body of the craft can be easily turned out, but when it comes to installing the machinery and adjusting it a delay results. In the balancing of the weights depends the efficiency of the submarine. Even one more man in the crew than had been provided for would throw the little terror out of plumb, and if the extra burden is toward the bow the boat may not rise to the top with the promptness expected. The machinery is placed with as much nicety as regards detail as the works of the finest watch. A mistake, however slight, may mean death to the imprisoned men, and, what is even worse in war, complete elimination of a factor that might mean the defeat of the enemy.

But the company feels perfectly safe on the time limit. It will make a fair profit on the vessels, and the bonus is worth striving for, as it will add \$750,000 to its exchequer. Constructor Spears, who formerly was an officer in the United States Navy, has made all arrangements for crowding the work. He has finished designing the vessels, which will be of the same type as the *Adder* and *Moccasin*, of the United States Navy. The boats will be capable of carrying a crew of from six to eight men. Their armament will consist of two Whitehead torpedo tubes, and for defense they will rely on the small target they present and their ability to sink below the surface of the water. They will be equipped with gasoline engines and driven by screw propellers.

The only means of entrance or exit is by the queer little scuttle-like conning tower, and only one man can go in and out at a time. Observations are made by utilizing this conning tower and they can be conducted while the vessel is in the awash position, and the rest of the body practically under water.

No interference by the United States authorities is expected. No nation which is neutral would, of course, sell a warship to a combatant, but that doesn't prevent a private concern from furnishing, at its own risk, supplies or implements of war to either belligerent. Only two nations—the United States and England—own submarine boats of the type ordered by Russia.

Our Trade with Spain.—United States Vice-Consul Byrne, at Valencia, reports as follows: "There is a marked increase in Spain's importations of United States products. As a direct result of the recent successful labor movement, with its consequent advance of agricultural laborers' wages, several American-built harvesters were imported this season by large farmers and operated with complete success on the extensive wheat plains of La Mancha, the cost of harvesting being reduced by one-half."

Death and Danger in Submarine Boats.

ON page 24 of the March issue of THE AMERICAN EXPORTER we printed a graphic account of the development of submarine boats with reference to the safety of the crew and their chances of escape in case of disaster, the problem being how the last man would be able to expel himself from the boat. Coming so soon afterward, on March 18th, the sinking of the crack British submarine boat "A1," which was run down by a steamship off the east coast of the Isle of Wight, losing her entire crew of eleven men, is of more than ordinary interest. The disaster has provoked much discussion in America, and the following editorial on the subject in the *New York Tribune* will be found both timely and interesting:

"The first fatal accident resulting from the use of a new implement of warfare has gone on record. The event occurred in time of peace and during experiment maneuvers, so that the loss of life in consequence is parallel to that which might be caused by the bursting of a gun on a battleship during target practice. A British submarine torpedo boat, while submerged only a few feet and lying in wait for a theoretical enemy, was hit by a passing merchant vessel and so disabled that her officers and crew, eleven in number, were unable promptly to escape. Though the precise truth may never be known, it seems probable that death resulted from the fumes of gasoline, spilled by the shock of the collision. This would certainly be a quicker consummation than dying from a slow exhaustion of the air supply.

"Whether the failure of the submarine to get out of the liner's path was due to the imperfection of her periscope, which may not have given a view of the whole horizon, or to lack of vigilance on the part of the officer in charge, is another doubtful point. However, if he had his wits about him immediately after the boat was hit, and nothing else interfered to prevent, he should have been able to bring the boat to the surface in a few minutes. By starting the electric motor which drove the pumps, he could quickly expel enough water—one would think—to impart the necessary buoyancy to the craft. Inasmuch as there had been trouble before with this part of the boat's equipment, perhaps it would not have acted promptly in the emergency. Again, even had the pumps worked satisfactorily, it is to be feared that the submarine would not have been right side up or in anything like a horizontal position on getting to the surface. The hatch through which the men could emerge would hardly be opened until this part of the boat was out of water. It seems probable that her trim was so badly spoiled by the blow she received that escape would have been difficult, if not impossible. Still another possible effect of the impact, especially if directed nearly at right angles, would be to sink the submarine almost instantly. The shells of such craft are exceedingly thin. If a big hole were stove in, water would pour and carry the damaged vessel quickly to the bottom. Drowning, not suffocation, would then cause death.

"From the momentary panic which this unhappy event will create among officers and men in the navies of the world there will soon be a reaction. It must be remembered that scores, if not hundreds, of trial trips have already been made by submarines without any serious mishap while they were submerged. Looked at merely from the statistical point of view, therefore, the chances of a repetition of this unfortunate episode are exceedingly small. They will be rendered still smaller by the precautions which the accident will suggest. Great Britain, like some other powers, maintains secrecy about the details of her latest model. It is conceivable, of course, that further improvements in design are possible. Perhaps better instruments for making observations when a boat is submerged may be needed. Maybe a compressed air chamber and trap-door in the bottom will be regarded essential. It is hard to avoid the suspicion, though, that the chief cause of the accident off Portsmouth was a defect of management rather than one of the submarine system. The latter will certainly not be abandoned because of anything that has yet happened."

Colombians Like American Footwear.

ALBAN G. SNYDER, the American Consul-General at Bogota, Colombia, sends to the Department of Commerce the following, which will be of interest to merchants in other countries: "As stated in a former report, the American styles of boots and shoes have gained a firm foothold in this market, and now some fifteen stores handle them, where a year ago they say you could hardly find them in Bogota. They seem to be growing in favor. The article they will have to compete with most is the high-class French shoe. One of the high-class shoemakers here, a Frenchman, who receives as high as \$12 per pair for his shoes, recently showed me several American lasts, bought in the United States, telling me that the demand made it necessary to get the American shapes."

Agricultural Implements in Australia.—United States Consul Orlando H. Baker, at Sydney, N. S. W., Australia, has sent an interesting report to the American Department of Commerce regarding agricultural conditions and the demand for machinery in that part of the world. He says in part: "It may be well to say that there is manifested a desire on the part of agriculturists of Australia to obtain the very best machinery in every industry, and that there may be seen at the district agricultural fair exhibits of machinery in motion which would compare with anything to be seen at State fairs in the United States. These fairs are held annually in all the larger towns and are always well attended." This explains why our agricultural implement trade with Australia is growing.

Steam—ENGINES—Gasoline.

We make a specialty of **Steam Engines** and **Gas and Gasoline Engines** and **Pumpers** from a 1 H. P. Combined Engine and Boiler for \$100 and a 2½ H. P. Gasoline Engine for \$125 up to any size in either **Vertical, Horizontal, Marine, Hoisting, Pumping, Locomotive and Portable Engines on Wheels.**

We also make a full line of **Saw Mills and Wood-working Machinery, Turbine Water Wheels, Corn and Wheat Mills, Feed Grinding Mills, Sugar and Plantation Machinery, Cars, Locomotives and Track, Etc.**

Send for Catalogues A, D, G, O and W. Correspondence solicited.

The Improved United States Cream Separator

Was awarded **GOLD MEDAL** (The Highest Award) at the Pan-American, Buffalo, N. Y., U. S. A. **GOLD MEDAL** Paris Exposition, Paris, France, 1900.

And the official records show that in the Model Dairy at the Pan-American ITS WORK EXCELLED EVERYTHING, averaging .0138 for 50 consecutive runs and WON WORLD'S RECORD for practical every-day work.

THE UNITED STATES SEPARATOR STANDS WITHOUT A PEER, THE MOST THOROUGH SEPARATOR MADE.

Dairy size U. S. Separators run easily by hand but can be operated by power if desired Capacities range from 150 to 700 lbs. an hour.

PRICES FROM \$50.00 TO \$165.00.

Large illustrated catalogues sent postpaid for the asking. Orders received through export commission houses. Please mail duplicate order to us.

"KNICKERBOCKER"

COMBINATION BILLIARD,
POOL AND (with Top)
DINING or LIBRARY TABLE.

This is an especially handsome old Dutch design, is solidly built throughout and has a weathered-oak finish. It is finished with regulation, best quality rubber cushions and has a genuine Vermont slate bed, covered with fine imported French billiard cloth. Equipment includes our PATENT POCKET COVERS, which make the table equally as good for BILLIARDS as for POOL. Six handsome cues, spliced butts, imported woods. FOUR GENUINE IVORY BILLIARD BALLS and SIXTEEN POOL BALLS accompany each table. Size of playing surface, 31-2 x 7 feet.

Price, Complete, \$84.50,

In U. S. gold or its equivalent, delivered F. O. B. New York.

Weight, boxed, 1,100 pounds (498.9 kilos); 106 cubic feet (3,000 cubic decimeters).

Our Catalogue, illustrating and describing our various styles of Combination Library, Dining, Pool and Billiard Tables, mailed postpaid.

Our Illustrated Catalogue, printed in colors, showing the various styles of Game Boards made by us, mailed postpaid.

Orders received direct or through export commission houses. When ordering through the latter, to prevent errors, please mail us a duplicate of order.

CARROM-ARCHARENA CO.,

Largest Makers of Game Boards
IN THE WORLD.

LUDINGTON, MICHIGAN, U. S. A.

Miniature United States Navy for the World's Fair.

NO feature of the Government of the United States will be more satisfactorily represented at the Louisiana Purchase Exposition than the United States Navy, and in these days of reports of engagements between war vessels in the Far East people are more than usually interested in knowing what warships are like. An elaborate exhibit, which is a perfect reflection of the service, is now being installed on a floor space 200 feet long and 77 feet wide in the Government Building.

The exhibit will give an intelligent idea of the internal and external features of American men-of-war, weapons and their use, of the great graving and floating docks in which fighting vessels are placed for repairs, as well as a representation of the actual life and duties of the officers and enlisted men of the navy and Marine Corps afloat and ashore, in war and in peace, together with the Government's facilities for educating officers and its methods of enlisting and training men and boys who compose the fighting personnel of the United States Navy.

Another interesting feature of the exhibit will be a working model of a graving or dry dock built to scale, illustrating the type and size of docks at various navy yards. The model of the dock and basin occupies a space 30 by 9 feet. In connection with the dock is a tank filled with water, representing a basin or harbor, in which a model of the United States battleship Illinois will be floated each day and the process of docking a ship will be shown in detail.

There will also be exhibited a working model of a steel floating dry dock, illustrating the type recently installed at the New Orleans naval station. The model will be afloat in a tank of water, which will also contain a model of a battleship built to the same scale. All operations incident to the docking of a vessel in a floating dry dock will be performed.

The United States Naval Academy at Annapolis, where future officers of the navy pursue their studies, is reproduced in miniature.

A pleasing, instructive and spectacular exhibit of the navy afloat and ashore will be a series of about sixty biograph motion scenes of the life and duties of officers and crews of men-of-war, both in war and in peace, as well as stirring lifelike scenes of maneuvers of vessels, torpedo attacks, manipulation and firing of great guns, landing parties, boat races, fire quarters, naval recruiting office where recruits are given physical and mental examinations to test their fitness for the requirements of the naval service, recreations afloat and general muster.

German Ship to Be Named "America."

ONE of the pleasing evidences of the friendly relations between Germany and the United States is the announcement recently made by the management of the Hamburg-American Line that the new giant steamship being built by that company will be named the America. Later on there will be a sister ship to this great ocean flyer and she will be called the Europe. The America will be the largest ship in the world flying the German flag, and will be launched shortly. She is a little larger than either the Celtic or the Cedric, of the White Star Line, which are now the largest vessels in commission.

The America and Europe will each have a displacement of more than 30,000 tons, and either will be able to carry more than 3,000 passengers, besides sufficient freight to load up forty trains of twenty cars each. Neither boat is to be a record-breaker, but will be a trifle faster than the Celtic. The ships are intended as great money-makers rather than fast travelers, following the precedent set for the Pacific ocean trade by the American builders of the big twin steamships Minnesota and Dakota.

To drive the America two sets of quadruple-expansion engines, turning twin screws, will be employed, the steam being furnished by eight double-ended steel boilers. The ship will have nine decks, four pole masts and two funnels, the latter rising to a height of 133 feet above her keelson, each smoke-stack being over twelve feet in diameter. The America and her mate will be 1,000 tons larger than the Kaiser Wilhelm II, which, with the Deutschland, is the fastest merchant vessel in the world. The America will be longer than the Great Eastern was, but will have less beam and draught, which will give her less displacement. Each ship will have two promenade decks, and will go even the new Baltic one better in the way of electrical and navigating appliances.

International Benefits Derived from New Ships.—The construction of the enormous steamships that are now being built is a benefit to the people of ordinary means in all countries who cannot afford to pay high rates and yet who do not wish to travel uncomfortably. The aim of the steamship companies at present is not to build fast steamships for the few people who can pay the highest rates, but to build large, safe, comfortable steamships that can carry the greatest number of passengers at a moderate rate of speed. The effect is to promote travel between the various countries of the world, with resultant increase in trade due to the observation of the travelers.

Saving Something After Big Fires.—The recent big fire in the city of Baltimore called fresh attention to an American invention for getting the greatest amount of salvage out of fire losses. The water-soaked material is placed in what is called a kiln; there are fans and other appliances, all of which diffuse the heat in an economical and effective manner. After the Baltimore fire there was a great demand for this apparatus, and it gave great satisfaction.

Our Plows and Reapers in Turkey.

UNITED STATES CONSUL THOMAS N. NORTON, at Harput, Turkey, contributes an interesting report regarding the progress of our foreign commerce in his consular district, from which the following extracts are interesting: "There is a steady increase in direct importations from the United States since the establishment of this consulate at the close of 1900. The introduction of American plows, harrows, drills and a reaper has attracted much attention. Some difficulty was encountered at first in training horses to draw the various implements. The results obtained from the deep plowing of the American plows have afforded most striking object lessons. All have been impressed by the difference in the yield of grain and cotton, when comparison is made with adjacent fields that had been cultivated with crude plows, duplicates of those used in the time of Abraham.

"The introduction of the reaper in 1902 was attended with many riotous manifestations of hostility from those who felt more directly the economic results of the advent of a machine displacing manual labor on so extensive a scale. During the harvest season of 1903 there was fortunately no repetition of the opposition. The reaper was kept constantly busy at various points in the fertile plains of Harput. General satisfaction has been expressed by the provincial authorities at the entrance of these modern appliances, and there is every prospect of a good market for our agricultural machinery being opened up in the immediate future.

"An agency has been established for American pumps and six have been introduced here. These all do good work and are highly regarded. At present they are run by hand power. A horse-power has been introduced, and I have strong hopes that this device may aid materially to solve the irrigation problem of the great Harput plain, where water is found abundantly at no great distance from the surface and where animal as well as human power is exceedingly cheap."

Bright Outlook for Our 1904 Export Trade.

EXPORTS of American industrial, manufacturing and food products promise to reach a degree of expansion during 1904 exceeding all previous records unless all indications are discounted. The New York *Commercial* has interviewed the heads of the large freight steamship lines, the leading corporations developing foreign markets and the established export houses of the city. The pith of the views may be summed up in the statement that large producing corporations, the manufacturers of machinery, tools, mining equipment and electrical contrivances, who have been devoting exclusive attention to the domestic consumers have started out upon exporting careers, the lead being taken by the United States Steel Corporation in making efforts to secure foreign markets.

Russia is forging forward as a buyer of American agricultural machinery. Following the recent award of the contract for 1,000 Westinghouse air-brakes to be used on the Russian railway, comes the news from electrical companies, including the Westinghouse and the General Electric, that Russia will prove a profitable market for American electrical traction supplies during the coming year, judging from negotiations now in progress with Russian authorities. Other marked features of the export trade, presaging a brilliant future, is the export of \$7,000,000 worth, approximately, of American boots and shoes, a growing demand abroad for American machinery and tools, the large exports of railway equipments and a growing trade with South and Central Americas.

American Light and Warmth for China.

IN many parts of the world the people sat at darkness until the exportation of American petroleum began. There are remote towns in the interior of China where the name of America is hardly known, but where tin boxes containing petroleum that are brought from the treaty ports are hailed with delight as vehicles of light and warmth, the true gospel of life. For over ten years the export trade of the United States has been increasing steadily and rapidly. The years 1901 and 1902 were unusually prosperous ones in the annals of the industry. The exports of petroleum and its products in 1902 amounted to 1,064,233,601 gallons.

This large amount was less, however, by 14,840,918 gallons than the number of gallons exported in 1901. On comparing the separate exports for the years 1901 and 1902 it appears that there was a considerable falling off in the naphtha and illuminating products in 1902, and an increase in the amount of crude, lubricating and residuum products.

America's Opportunity in Asia Minor.—Edward J. Sullivan, United States Consul at Erzerum, Turkey, writes of the opportunities existing in that region for American manufacturers, in part as follows: "I am in constant receipt of requests, personal and otherwise, from Trebizond merchants asking that the manufacturers of the United States seriously consider the opportunity that presents itself for trade and commerce in Asia Minor."

American Machinery in Colombia.—The last available yearly report of the commerce of Colombia shows that American agricultural and other machinery is duly appreciated by the people of that country. On a basis of pounds Colombia's chief imports were: From the United States, 133,321; from England, 59,281; from Germany, 10,025.

De Laval Cream Separators.

Immediate and absolutely complete separation of cream from milk by machinery.

500,000 Machines in Use throughout the Dairy World.

A saving of 10 to 25 per cent. in any climate, and 25 to 100 per cent. in warm countries.

Increased Quantity and Improved Quality of Butter and Cream.

Machines Simple, Durable and Easily Operated.

Satisfaction Guaranteed.

Prices, \$50 to \$225.

Uncle Sam's New Measuring Bureau.

MEASURERS who figure in millionths of an inch or millionths of a degree of temperature are to be found in the new Bureau of Standards established by the United States Government. Some marvelous achievements are attributed to the bureau, such as measuring a candle-light six miles away or the splitting of a human hair into a thousand widths, either of which is of no practical value. In other directions, however, the bureau is of benefit to commercial progress.

Information concerning standards and the methods employed to secure them will be furnished for the benefit of the United States Government, any State or municipality within the United States, scenic societies, educational institutions, firms, corporations and individuals engaged in manufacturing or other pursuits. Prof. William Hallock, of Columbia University, who is identified with the work of the Bureau of Standards, explained the importance of the new institution.

"Many people are at a loss to understand," he said, "how the researches and tests of this bureau can be of any practical value to the average citizen. What does he care, anyhow, about standards and decimal subdivisions? Just this much: If he buys a thermometer or an incandescent lamp or a set of scales or a lens or a machine—steam, gas, electric, pneumatic or hydraulic—or any one of the thousand contrivances in common use, he wants to know whether it is what it should be and whether it conforms with standards recognized in other parts of the world.

"To manufacturers whose products are brought into competition with those of other countries this knowledge is of the greatest importance. If American manufacturers, in offering their goods for sale in Europe, should represent them to be of a certain degree of fineness, or as fine as similar European products, and expert comparisons should show that the facts in the case had been misstated, it is easy to see what would happen.

"It has been necessary in the past for manufacturers in this country to pay individual experts fancy rates to test the quality and powers of their output, to make such tests themselves at much trouble and expense or to ship their goods to France or Germany for inspection or measurement by foreign physicists. Now all this may be done right here, and instead of costing from \$25 to several hundred dollars, the needed information may be had almost for the asking—a fee of only \$2 or \$3 being charged by the bureau to prevent its being deluged with nonsensical requests.

"Suppose you are buying or are manufacturing for sale some incandescent lamps which should be, for example, 16 candle-power on a 110-volt circuit. You can send one of these lamps to the bureau and receive in return an official certificate stating whether it is or is not up to the standard. The laws define the unit of electrical strength and resistance, and also the resistance of a given column of mercury. The strength of an electrical current is determined by ascertaining the amount of silver which a specific current will deposit in a given length of time, as in silver plating. All we have to do is to weigh the silver deposited and we have the standard of current immediately.

"From time to time I have asked the bureau to test for this laboratory different pieces of electrical apparatus, such as cells, dynamos, ratio coils, resistance boxes and transformers. Other laboratories, as well as manufacturers, have submitted electric motors, steam engines, gas engines, microscopes, telescopes, photographic lenses, etc. The weights used recently by the Assay Commission were all standardized by the Bureau of Standards.

"If an American merchant is about to purchase some copper for electrical purposes that has shown to him a quantity of that metal and is told that it is of a certain conductivity, all he need do is to send it to Washington and find out if it has been correctly represented. The same thing is true as to the purity of gold and silver and all other metals. In the course of time the bureau doubtless will be able to test radium, thorium, actinium, polonium and other radio-active substances with the same degree of skill that has characterized its other experiments. In fact, in this field alone the bureau promises to be of immense value to our citizens, since it is commonly believed that radium and like properties soon will be found in abundance in the United States.

"It frequently happens that an indirect advantage to commerce and science results from the bureau's investigations. New methods of manufacturing devices or of improving those in existence are suggested. Afterward they are adopted and become popular. Many of the instruments of great value to-day are the outgrowth of hints received during these tests."

Automatic Device to Kindle Fires.

AN automatic fire kindler, the operation of which is regulated by an ordinary alarm clock, will doubtless appeal to every person whose duties include getting up early to start the fire in the kitchen stove. The *Saturday Evening Post*, of Philadelphia, U. S. A., gives the following information on the subject: "With this new contrivance installed in a house it is necessary, upon retiring, simply to assemble the fuel in the stove or any fireplace, connect an attachment to the clock and set the latter at any required hour. When the alarm sounds a fulminate is ignited, which, communicating with an inflammable substance in the stove, range, furnace or grate, immediately starts the fire. By the time the householder or servant is up the fire is burning briskly and the water is boiling.

"It is claimed that these new devices may be so set that they will start fires whenever wanted and thus have a home thoroughly heated before the occupants

stir from their beds. From the back of the clock used in connection with the automatic fire kindler extends a shaft on which is mounted a rotary friction disk or pulley, the periphery of which is milled or otherwise designed to create friction when rotated in contact with a relatively stationary member. By the operation of a pivotal arm, a lug and spring and other attachments in connection with the rotary disk, this entire external mechanism is set in motion when the alarm is released.

Instantly a fuse, with an easily ignited fulminate at its end and held in place in a slot opening against the friction, is set afire. The flame, properly confined within the metallic slot, travels instantly over the fulminate strand, which is saturated with a free-burning ingredient. The clock may be set on a nearby shelf or on the back of the stove or a furnace projection. As even a small and cheap alarm clock may be utilized, and as the tube incased fire strand may be safely controlled, that part of the problem is very simple. Moreover, any kind of kindling substance ordinarily used may be utilized. The fuse may be employed merely to ignite paper under the regulation kindling wood fire, with coal or cord wood on top. In such cases the action is similar to that of a match, or, rather, several matches lighted simultaneously and burning longer than ordinary matches."

Interesting Facts About Ocean Cables.

ONE of the most convincing evidences of the spread and growth of international trade is shown in the development of electric intercommunication between various parts of the globe. The ocean telegraph cables of the world now in operation have ownership in twenty-two different countries and comprehend a total length of 252,436 miles. Denmark has a more prominent place among countries whose capitalists have engaged in laying ocean cable lines than might be expected from her inferior commercial importance. She ranks fourth on the list, even surpassing Germany. The reason is that the Great Northern Telegraph Company, with its offices at Copenhagen, laid and operates one of the most important cable systems in the Orient—that which connects Vladivostok with Nagasaki, Shanghai and Hong Kong.

There are in operation now only 38,797 miles of ocean cable, or about 15 per cent., owned by governments, the remainder being in the hands of private owners.

The British cables which connect London with all parts of the world have a length of 154,099 miles, of which 14,963 miles are owned by the Government. Of the 139,136 miles owned by private companies the longest mileage is in the Australian and Oriental lines. The Eastern Extension, Australasia and China Telegraph Company controls 27,609 miles and the Western Telegraph Company 19,880 miles.

The most important of the British cable lines are the five that stretch across the North Atlantic, and also the first line stretched across the Pacific, which connects Vancouver with the Fiji Islands, Norfolk Island, Queensland and New Zealand, and which was opened on December 8, 1903. Among the many British lines also are cables to South America and along both of its coasts.

The United States controls 44,470 miles of cable, nearly all in private hands, the Government controlling only a short mileage in Alaskan waters. The most important are the five lines across the Atlantic and the second great Pacific cable, completed on July 25, 1903, by the Commercial Pacific Cable Company, between San Francisco, Honolulu, Midway Island, Guam and the Philippines. Another great line laid down by American capitalists is that on the Pacific coast between the Isthmus of Tehuantepec and Valparaiso, Chili.

France has a total length of 24,010 miles, of which 10,092 are the property of the State. The most important of the submarine connections of France are the two lines which connect Brest with the United States.

As already mentioned Denmark is fourth on the list, with 9,488 miles. Germany has 9,228 miles of cable, of which more than one-third is owned by the Government. Its most important cable service is that between the Island of Borkum, Fayal and New York City. The seventeen other countries which take a financial interest in cables have altogether only 11,131 miles of lines, nearly all of them owned by the various governments.

New Railroad Track Wanted.—Several of the American magazines published for railway men and engineers are asking for the invention of a new kind of railway track. The present track, they say, has been the same for thirty years and cannot bear fast travel as it should. The old wooden cross-tie is in use everywhere, though it was long ago out of date. There is no evenness or elasticity in the broken stone and gravel upon which the ties rest. The foundation is unequal. It requires the most constant attention. A flood will destroy it in a few hours. American inventors are not idle, but improvements in this direction are slow. Iron and steel ties have been tried with indifferent success, and the idea of making ties from refuse leather has been found impracticable. Something brand new in railroad ties is in order and some American inventor probably has it up his sleeve or in his mind.

Electric Motors Wanted in France.—There has been an inquiry at this office for prices of small electric motors. They should be of from one-twelfth to one-tenth horse-power, as compact as possible, and capable of running in two directions. Prices should be submitted for samples of 1 and in lots of 100 and 1,000.—George H. Jackson, United States Consul, La Rochelle, France.

The Domestic Incandescent Oil Lamp.

Growth of the Collar and Cuff Industry.

COLLARS and cuffs! "Fudge, there cannot be anything especially interesting in them," the average reader will say, but the industry is one of peculiar interest from the time of their invention down to the present era of the machine-made articles. When the wife of a blacksmith, in Troy, N. Y., U. S. A., got tired washing and ironing her husband's shirts, with collars attached, it started her to thinking, and she finally picked up her scissors, cut a paper pattern and then the linen for a collar. That was over seventy-five years ago, and it was the first separate collar ever made in the world.

This forgotten woman was the mother of invention that first conceived the idea from which has sprung the great industry that now provides this article of neckwear in artistic shapes for men and also mannish women. To-day the use of machines has supplanted hand labor in nearly every department of the industry, not only in the factory, but also in the laundry, and these machines will be seen in operation turning out collars and cuffs ready to wear in the forthcoming American World's Fair.

Visitors will see the entire process of collar and cuff manufacture, from the linen cloth to the finished product. Grouped near the machinery will be fine show-case displays of the numerous styles of cuffs and collars.

When the blacksmith's wife started the fad of detachable collars it was soon looked upon as a great reform in men's wear in the little town of Troy. Old Ebenezer Brown, who had retired from the Methodist pulpit and was devoting more time to saving dollars than souls, ran a small dry goods store, and was the first person to start a collar factory. The manufacture of collars soon became a paying business for Parson Brown, and history does not record that he ever returned to the pulpit.

This Yankee-witted parson, it seems, was blessed with a large family of girls, and at first they made all the linen collars, the cloth being cut to shape with scissors, hand-stitched and starched and ironed upon the kitchen table. Soon the increasing demand for Brown's "store collars" became so great that he was compelled to secure the services of a large portion of the wives and daughters of the whole town. They flocked to his store, which was enlarged, where the cloth was cut on a wooden pattern, which was the forerunner of the modern cutting-table. They then took the material to their homes and made, washed, starched and ironed the collars, and the shrewd parson paid them in merchandise from his store. At that time the collars were tied around the neck of the wearer with tape string and were known as "string collars." It was too early for the necktie to supplant the string. These heavy, two-ply collars, starched as stiff as a board, were supported by haircloth stocks buckled at the back of the neck.

For a long time other collar manufacturers imitated Parson Brown by making collars as a side line to some other business, and it was not until 1843 that the first separate business of collar and shirt bosom manufacture was begun. Then the independent stock and collar maker appeared, and another man added a laundry to his collar factory and laundered his own goods. Up to his time everybody was wearing home-made linen cuffs and shirts. In 1845 the collar business put the idea into some man's head to start a cuff and shirt factory in Troy.

Then the invention of the sewing-machine followed, and it was soon introduced into the manufacture of collars, cuffs and shirts, despite the cry of the workers against the labor-saving machine. Then the application of steam power later gave the industry a wonderful impetus by greatly decreasing the cost of production and causing a corresponding decrease in the price to the consumer. Then, from time to time various machines for this special line of work were invented, until the industry thereby was enabled to reach its almost perfect state of to-day. About \$9,000,000 are invested in this industry in the one city of Troy, and American collars and cuffs are sold all over the world.

High Aims of United States Commerce Secretary.

AMERICAN policy was never better defined than when Secretary Cortelyou, of the Department of Commerce, declared recently in an address to the New England Jewelers and Silversmiths' Association that it was "constructive, not destructive." Speaking of his efforts to make his department useful to commerce he said:

"The department aims to be helpful to such interests as those you represent. We shall try to establish high standards in its work. We shall try to make it a business department. We shall try to supply it with modern appliances and up-to-date equipment. We shall try to secure for it the best trained and most intelligent personnel possible. We shall do away with useless red tape and meaningless ceremony in the conduct of the public business. We shall try to have its chief officials men who are directly accessible to the people, loyal in their service and devoted to their work. We shall, in every bureau and division, set a high standard and a high ideal, and while many of us may not measure up to either, we shall give to the work the best that is in us."

Our Trade with Switzerland.—A London correspondent of the *American Machinist* says: "While our British exporters of machinery and general manufactures have been content with a 4 per cent. increase in their trade with Switzerland during the last seven years, American exporters have increased the value of their business with that State by 58 per cent! The comparison is more remarkable when we consider that Switzerland is within two days' easy journey of London, and is about ten to fourteen days from New York."

New Precious Gem Found in America.

A NEW gem, lilac colored and transparent, has been discovered. It has been found in two distinct places in California, the most plentiful deposit being only a short distance from the town of Pala, and within a mile of the famous rubellite mine near that place.

At the Museum of Natural History a thorough analysis of the mineral has been going on under the direction of Dr. Charles Baskerville, of the University of North Carolina, who won a reputation among scientists last spring by his address before the American Chemical Society on certain rare earth used for many new forms of incandescent lights. By the action of the Röntgen rays he excited a crystal of the new mineral sufficiently to make it photograph itself when placed upon a sensitive plate and kept in the dark for ten minutes.

This unusually phosphorescent mineral was discovered by Dr. George F. Kunz, president of the New York Mineralogical Club and a gem expert. He has given a description of the finding and of some of the properties of the gem. That the new stone is unlike any other known, however, was determined by Dr. Baskerville in his analysis at the museum. In a scientific article which he has prepared for publication he gives it the name of Kunzite, in honor of its discoverer, Dr. Kunz. Almost simultaneously with the choice of this name, Prof. Edward S. Dana, of Yale University, who has been informed of the progress of the analysis, wrote suggesting the same name.

Near Pala, Cal., crystals of the new gem as large as a man's hand were found. The tint is described by Dr. Kunz as a sort of "rosy lilac," varying from a very pale tinge, when looked at transversely, to a rich amethystine hue, when observed lengthwise. When cut and mounted in a certain way, one of these crystals yields a gem of unusual beauty. The discovery is of more than ordinary interest because nothing similar to the new gem has ever been seen by gem experts or jewelers before.

In the course of tests by Dr. Baskerville the Kunzite crystals were subjected to the action of ultra-violet light without showing any evidence of fluorescence or phosphorescence, and it was not until it was subjected to the bombardment of X-rays of very high penetration that it became at all fluorescent. On its removal to a dark chamber, it exhibited a persistent white luminosity never before observed in its class of minerals. The color of Kunzite is distinctive. As a cut and mounted stone, the softness of the lights gives to it a variety of beauty possessed by no other jewel. It nearly approaches in color some varieties of pink topaz and pink sapphires.

Can Anybody Be Much More Accommodating?

MOST Americans, certainly all of the really successful ones, are courteous and accommodating at all times, but a New Yorker who recently encountered an unexpected rainstorm the other day found what was to him a new wrinkle in American department stores. He had no umbrella, only a cane, and if any situation is calculated to make a man feel foolish it is to walk in a busy street on a rainy day swinging a cane. The man took momentary shelter in a New York dry goods store and bought a collar, not because he needed it, but because he thought he ought to pay rent in some shape.

To the young woman who sold him the collar, and who was comely enough to be worth talking to, he voiced, as politely as possible, his views on the weather and his opinion of the man who would be caught out on such a day only with a cane.

"That's easy," said the young woman. "Why don't you let us send it home? If you'll just step over to the accommodation desk with me I'll fix things for you in a minute."

The accommodation desk was new to the man, but he followed obediently, and in a far-away corner of the store he was made acquainted with another young woman who seemed to take as a matter of course a request to send a cane to a downtown office for a man who had no account at the store and who had never patronized the store more than twice in his life. There was apparently nothing unusual in the incident, so far as the store folks were concerned, but it impressed the New Yorker with a phase of American trade with which he was not familiar.

Radiator as an Incubator.—While carrying on a series of experiments in his laboratory with chicken life during the embryonic stages, Dr. Counter, a young dentist of Toledo, U. S. A., succeeded in hatching a chicken by means of an ordinary steam radiator. The egg was placed in a small paper box and hung from the radiator during the period of incubation. At the end of the twenty-one days the chick was hatched, and has since been kept in a paper suit box, about 3 by 1½ feet, with a little shelter in one corner of it. The box was hung near the radiator, and its inmate, when three weeks old, was as strong and vigorous as one could expect a chicken to be raised under natural conditions.

Fencing Free of Duty in Costa Rica.—By a recent decree, woven galvanized steel wire fencing will be admitted free of duty, provided the widths of the meshes is not less than 8 centimeters, or a little over 3 inches.—*John C. Caldwell, United States Consul, San José, Costa Rica.*

Sewing-Machine Exports Increased.—American sewing-machines were more popular than ever abroad last year, the exports aggregating \$5,340,474, a gain of about three-quarters of a million dollars.

WIZARD NOVELTY CO., Inc., Philadelphia, U. S. A.

A Wonderfully Interesting Commercial Map.

ONE of the largest maps in the world has just been installed in the office of Secretary Cortelyou, of the Department of Commerce, at Washington, U. S. A. It is known as a commercial map of the globe, and it probably contains more information of a commercial character than any other map ever made. Its dimensions are 16 feet long by 7½ feet wide, and the sixteen sheets of the largest size hand-made paper, of which it is made, were so delicately fitted together that it appears like one huge sheet.

The map was prepared by the United States Coast and Geodetic Survey, under the direction of Secretary Cortelyou, with special reference to the needs of his department. Practically all the large maps and atlases published in recent years were consulted in the compilation of names, shore lines and political subdivisions, with much additional information derived from detail charts, gazetteers and books of travel. The reports of the Board of Geographic Names were taken as authority for the spelling of names, but thousands of names are given which do not appear in these reports. Names which were thought to be of little value for the purpose of such a map were omitted, however, in order that those given might stand out with greater distinctness.

A unique feature of the map is the location of the continents, which is different from that shown on any other map or atlas heretofore published. It has been the custom of all mapmakers to show the Western Hemisphere at the left end of the map and the Eastern Hemisphere at the right, Bering Sea being the dividing line. On this map the American continents occupy the center, thereby permitting the entire Pacific Ocean and the trans-Pacific steamship and cable routes to the Philippine Islands and Hong Kong to be shown without a break in the center of the Pacific, as has always been the case heretofore. The Eastern route via the Suez Canal to the Philippines is also continuously shown.

Cities having a population of between 10,000 and 40,000 are indicated in a distinctive manner. All the United States consulates are given, as well as most of the consular and commercial agencies, and in those parts of the world where international complications are likely to occur all steamship ports are shown. All submarine cables are given, including the new cable between San Francisco and Manila, via Honolulu; the new cable between Victoria, B. C., and Brisbane, Australia, via Fiji Islands; the new cable between New York and Emden, Germany, via the Azores and Lisbon; the new cable between Port Natal, South Africa, and Perth, Australia; the new cable under construction between Seattle, Wash., and Sitka, Alaska, and the telegraph line from Vancouver, B. C., to different points in Alaska, as Juneau, Dawson City, Valdez, St. Michaels and Nome. The Trans-Siberian Railway from St. Petersburg to Port Arthur and Vladivostok is given, as well as the route of the Cape to Cairo railway in Africa, as yet uncompleted, and the spur of the Manchurian Railway that is being built directly to the back door of Peking, via Rhaihr and Ralgan.

The most difficult feature in compiling a map of this kind is in defining the political boundaries, which are as accurate as could be ascertained down to the very day the work was finished. Among the recent changes in boundaries may be mentioned the new Abyssinian boundary, the new arbitration boundary between Chili and the Argentine Republic, the new boundary between Brazil and Bolivia, the Anglo-Turkish boundary at Aden and the Spanish and French agreements on the west coast of Africa. There also is a question as to the political status of certain other countries, as for instance the province of Novibazar, between Austria and Turkey; the Egyptian Soudan and certain leased sections, as the locality of Lodi, between British East Africa and the Congo Free State.

Technical Education by Different Methods.

THE educational question is one that is intensely alive at present in all the great national centers of the earth. Contributions come to it from many sources, but some of the controversialists do not consider the subject from the viewpoint which is taken by James M. Dodge, president of the American Society of Mechanical Engineers, in a recently published article, in which he makes comparison between the improvement made by the boy who enters a training school and that made by the boy who goes to work at once in a mill or factory. He finds that the advantage in self-improvement lies with the boy who goes to the training school. He calculates the problem in an ingenious way, figuring the boy's wages as interest and estimating his cash value, as thus established. That is to say, the untrained boy of 16 can earn \$150 a year. This is 5 per cent. on a valuation of \$3,000, which may be taken as the "present worth" of the boy.

Mr. Dodge figures that for nine years the boy who goes into the shop increases his earning power \$65 a year, or his capitalization \$1,300 a year, while the boy who enters a training school increases his ability to earn \$105 a year, or his capital value \$2,100 a year. In other words, he estimates that the boy who goes directly into the mill or factory at 16 will be able upon arriving at 24 to earn \$15 a week. The boy who enters the training school will be able to earn \$20 a week, and will reach this point at the age of 20 instead of 24. Only one boy in twenty, Mr. Dodge declares, who goes into the factory direct, ever gets above the point of \$15 a week.

The calculations made by Mr. Dodge are undoubtedly for a number of different trades, taking an average. His conclusion is that it is vastly better for a boy to capitalize himself, so to speak, by entering the training school than to go to work at once in the factory. He argues that he becomes a more valuable man to the community for all the rest of his life. Howsoever advan-

tageous this plan may be, very few boys are financially able to thus provide for themselves. They have to get into active earning before the age of 20.

On the other hand, many of our most successful Americans are those who have gone into the professions or occupations in which they have won successes without much more education than they have acquired by their own efforts outside of schools. They have reversed the present order of technical training, earning their support by practical experience and acquiring more knowledge in their spare moments. Young men who can apply themselves thoroughly in this way will always have a distinct advantage in America as well as in other countries. The only difficulty is that they must work harder and have more ambition than their more fortunate rivals who are able to pay to learn. America, however, seems to be able to produce both sorts of progressive, ambitious chaps.

Uncle Sam as the Fisherman's Friend.

WITHOUT being at all paternal, the United States Government goes into subjects that it would scarcely be expected to take within its official observation. There are fishermen all over the world, more of them amateurs than professional, and whichever they may be, they all are as much interested in the preservation of the various families of the finny tribes as they are in making record catches. Dr. Hugh M. Smith, in *Collier's Weekly*, describes the workings of the United States Fish Commission in an interesting article, from which the following extracts and summaries are taken:

There are now thirty-five Government fish nurseries, located in twenty-five States. In the stocking of public waters it is necessary to deal not with thousands or millions of young fish, but with hundreds of millions and even thousands of millions. Thus, during the current fiscal year, the indications are that previous records will be surpassed, and two thousand million fish, hatched by a paternal Government, will be turned loose to shift for themselves.

Upward of thirty different species are bred at the Government stations, but a very large part of the energy of the commission is applied to the great commercial species—the cod, the shad, the salmon, the whitefish, the lake trout, the wall-eyed pike, the flounder and the lobster—the total annual catch being worth upward of \$17,000,000, and one and three-quarter billions of young having been sometimes liberated in a single season.

A large proportion of the eggs handled are taken from fish which have been caught for market, and hence would have been lost but for the commission's efforts. In the case of the lobster, the shad, the lake trout, the pike, perch and some other species, every egg taken, every fry hatched, represents a clear gain over nature. The leading river fish of the Eastern seaboard is the shad. The great multiplication of all kinds of fishing appliances results in the capture of a very large part of the run each season before the shad reach the spawning grounds.

The steady increase in the shad catch in the face of these conditions is evidence of the beneficial effects of propagation. In 1880 the total yield of this species from Maine to Florida, the extent of the United States Atlantic coast, was 18,000,000 pounds; during the four succeeding years the supply in many of the streams decreased to such an extent that the abandonment of the fishery was imminent. From 1885, when the largely increased plants of fry began to produce results, until the present time, the trend of the fishery has been steadily upward. Against a product of 18,000,000 pounds, worth \$995,000, in 1880, is to be placed an annual catch of over 50,000,000 pounds, valued at \$1,700,000.

Very lucrative shore cod-fishing has been established on grounds that were entirely depleted or that had never contained cod in noteworthy number in the memory of the oldest inhabitants. There is much unsolicited testimony of many people who have profited from the past ten years' hatching operations at the Government's Gloucester and Wood's Hole stations.

The most important acclimatization experiment with indigenous fishes has been the planting of the shad and the striped bass on the Pacific Coast. Comparatively small plants of young fish immediately took root and multiplied, and in a few years both species became abundant. The expense of introducing these two fishes into Western waters was less than \$5,000.

Great Gain in Trade with Germany.—Germany's trade with the United States has advanced rapidly in the last decade. Our exports to that country in 1903 were \$225,000,000 and our imports were \$122,000,000. Our commerce with Germany has grown much more rapidly in the last decade than that with the United Kingdom. In 1893 our exports to Germany were only \$88,000,000; in 1903 they were \$225,000,000, an increase of over 150 per cent., while in the case of the United Kingdom an increase is shown of only 30 per cent.

The New Sturtevant Catalogue.—Readers of THE AMERICAN EXPORTER who are interested in blowers, engines, motors, generating sets, forges, steam-heating apparatus and various other devices in that line, including disk fans, will be interested in this new hand-book of the B. F. Sturtevant Company, Boston, U. S. A., which they can obtain upon application. The catalogue is a model one, from the point of compressing a vast amount of information into a relatively small space.

Electrical Goods.—"I believe there is a good opportunity for some enterprising American company interested in electrical material to make good connections here, although it must be prepared to fight German competitors, who are, so I am informed, largely interested in the electrical companies established in Batavia, etc."—B. S. Rairden, Batavia, Java.

Over 600,000 Sold Throughout the Civilized World.

BOOK OF RULES in English, Spanish, German or French accompanies each Game Board. PLEASE SPECIFY LANGUAGE DESIRED.

No. 2—Carrom Game Board

Is furnished with equipment for Fifty (50) entertaining games.
Price, per dozen, . . . \$18.00.

ALL PRICES quoted (U. S. gold or its equivalent) are for **EXPORT ONLY**, and include boxing, ready for steamer, delivered f. o. b. cars New York City.

NOTE.—Each Game Board measures twenty-nine (29) inches square (53.16 centimeters); one dozen Game Boards, boxed for export, weigh 206 pounds (96.4 kilos, 13.76 cubic feet (0.3896 cubic meters).

[illegible]

Our illustrated catalogue, printed in colors, showing the various styles of Game Boards made by us, mailed postpaid. We will also forward, postpaid, our catalogue, illustrating and describing our many styles of **COMBINATION LIBRARY, DINING, BILLIARD and POOL TABLES**. Orders received direct or through export houses. When ordering through the latter, to prevent errors, please mail us a duplicate of order.

Visitors to the World's Exposition are cordially invited to visit our WORKS at LUDINGTON, MICHIGAN, U. S. A.

SMOOTH-ON

IRON CEMENT No. 1

Three Rivers, P. Q., Canada,

Feb. 10th, 1904.

SMOOTH-ON MFG. CO.,

Jersey City, N. J.

Dear Sirs :

Please send us on 100 lbs. of your Smooth-On Cement at your early convenience. We could not reply to your first inquiry as to how the cement worked when you first wrote, as we had not yet used it, but we can say now, for your satisfaction, that even the small lot you sent us as a sample has been worth its weight in gold to us. We had a special hydraulic main on which we had tried every available means of making gas-tight without avail. One of our men thought of using your cement one day, and since then all our troubles have ceased.

Yours very truly,

Three Rivers Gas, Heat and Power Co.

Send for Catalogue and Prices.

MOON DESK CO.

Muskegon, Mich., U. S. A.

Cable Address: "MOON," Muskegon.

No. 63, Grade 1

No. 63. 60 inches long; 36 inches wide; 52 inches high; weight 400 pounds
No. 64. 66 inches long; 36 inches wide; 52 inches high; weight 430 pounds

A VERY handsome swell front desk. Four letter file drawers with cast brass label holder pulls, each drawer supplied with index and our special compressing device; 14 cherry pigeon-hole boxes 11 inches deep with quarter-sawed-oak fronts; pigeon-hole boxes are trimmed with cast brass label-holders and highly polished cast brass knobs; bracket drawers. Large swell front centre drawer. Pedestal drawers have handsome cast brass ball and socket pulls. No charge for inkwell set.

Special attention given to filling Export Orders. Send for Illustrated Catalogue and Export Price List. Order through buying and shipping agents, and send us duplicate of orders, so as to avoid mistakes.

Turbine Engines on Great Steamships.

FIRST of the great steamship companies to utilize the turbine principle of propulsion upon its vessels is the Cunard Company. Cable advices announce that it has made a contract for two new big steamships, to be named the Caronia and the Carmania, the latter to have turbine engines and both to be additional to the ships which the company must build under its agreement with the British Government. The decision of the directors of the company to adopt turbine engines is an event of no small import. It may mark a revolution in marine enginery not only for merchant vessels, but for those of the navies of the world. The decision was reached after a thorough investigation by a commission, of which Lord Inverclyde was the head, and the change would be adopted without the most positive assurance of success. The new turbine steamship is intended to be not only the largest, but the fastest merchant vessel afloat, and it must be specially designed for naval auxiliaries in case of need. Consequently, its engines must be of the most powerful kind. Steam economy is not yet claimed for the turbine engines over the quadruple expansion type of equivalent power, but they occupy much less space and are simpler in their operation, producing little or no vibration. It is believed that they will prove cheaper to operate on a heavy scale, in addition to the economy of space, which is an important point in sea-going vessels.

Commenting upon the action of the Cunard directors, the *New York Journal of Commerce* says: "The turbine steam engine is a comparatively recent product. It was first used with effect as a stationary engine on land to drive machinery, and has been successful on a constantly increasing scale. It has been tried on vessels of smaller size on water, and there also success has been achieved and has not been checked by increase of size thus far. The Inverclyde Commission had the benefit of the assistance of Mr. Broch, of the firm of Denny Bros., who was one of the first to apply the turbine to marine engines, and is connected with the firm that has built the largest steamers yet using them. It is evident that his experience has produced the conviction that it is adapted to the huge vessels that the Cunard Company is about to build. A mistake would be so costly that hardly a chance would be taken of incurring it in such an important venture.

"There is no doubt about the interest with which the development will be watched the world over, and it seems probable that in the marine construction of the future, both commercial and naval, the old complicated and cumbersome type of engine will be gradually displaced. There is promise of decided economy of space in the vessel, increased speed, practical elimination of vibration and reduced cost of operation, all of special importance in ocean-going craft."

The Allan Line, plying between Great Britain and the Dominion of Canada, has also taken up the turbine idea. The new steamers the company is now building for its improved Canadian mail service are to be propelled by turbines instead of by the usual reciprocating steam engine, and it is claimed for this method—adapted, as it is to be, in an especial manner for Atlantic navigation—that it will so greatly change for the better the movement of large vessels at sea as to bid fair to revolutionize Atlantic passenger travel. The first of these steamers, named the *Victorian*, is now well advanced, and is to be ready for her tour of duty in the autumn of the present year. The *Victorian* will be by far the largest steamer, as she will also be the swiftest, of the Allan Line fleet. She will be fitted in the most modern style for upward of 1,500 passengers, and is expected, by reason of the absence of the vibration inseparable from the ordinary steam engine, and the rapidly and unbroken steadiness of revolution in her shafting and propellers, to be at once noiseless and steady in a seaway, even while exerting all her great power.

In the application of the turbine principle to all sorts of propulsion it is noteworthy that American inventors have led the way. It is to the credit of our British cousins that they have not been slow to recognize the merits of the turbine.

Real Daily Newspapers on the Ocean.

SOME enterprising Americans are planning a new international daily newspaper which they expect will be launched—and that's the best word for it—on May 15th. It will be printed simultaneously on most of the trans-Atlantic fleet while they are in transit.

The projectors expect to place news of the world before the 20,000 to 30,000 passengers afloat at breakfast time every day this summer much in the form that the readers are used to finding it in New York or London. The paper will be made up like a regular city journal.

The Marconi apparatus, of course, will be the means by which the news will reach the ships. All the lines except one are equipped now with the wireless instruments. The ships of the American, Red Star, French and both German lines and some of the Atlantic Transport ships now issue a daily bulletin of news from a summary supplied them by a bureau of publicity, which has its headquarters in Boston, U. S. A. The Cunard Line gets its news from Reuter's agency.

Ships with the Marconi equipment are now practically in constant touch either with one or other of the Marconi transmitting stations at Poldhu, England, and Canso, Nantucket and Babylon, on the American coast. It is completely practicable to expand the present news service into as full a telegraphic report as a well-managed newspaper need have ashore, covering everything from the Far Eastern war to market reports.

The newspaper enterprise will be under the control of a single concern, which will establish an adequate plant on each of the ships. The editorial

and business offices will be established either in New York or London. It is a matter of detail to supply each ship on its sailing with sheets on which the advertising matter has already been printed, so that the news only need be "set up" and printed on board ship. The promoters of the enterprise argue that a daily circulation of above 20,000 copies will attract a high class of advertising. The newspapers will be assured of a reader in practically every passenger and ocean passengers, as a class, are a good class to appeal to. Naturally hotels, theaters, resorts and railroads will figure largely in the advertising columns. Each ship will require a typesetting machine, a stereotyping plant, a good quick press and the men to run them.

The Associated Press offices in New York and London will supply the news. On the first three days of a ship's journey eastward the despatches will be sent from New York. Then London will take up the service.

American Machinery in Syria.

ADVANCES in agricultural methods are being made everywhere in the world. United States Consul G. Bie Ravndal, at Beirut, in a recent communication to the Department of Commerce tells some things that will be of interest to many of our readers. He says in part: "There is no economic movement in Syria more important or more interesting than the introduction of American machinery. Owing largely to emigration to North and South America, wages in this country have been growing at such a rate that it is no exaggeration to declare an increase of 40 to 50 per cent. during the last fifteen years. Wages are still low, the unskilled laborer receiving an average wage of 25 cents a day. I have no doubt, however, that the age of machinery is dawning upon this country.

"Agriculture is the main industry of Syria, but it is in an extremely backward state, the implements commonly in use being the same as those in vogue in the ante-Christian era. Large tracts of land of great fertility lie waste and depopulated, though showing traces of former prosperity and teeming populations. Agricultural and irrigating machinery and railroads will prove strong factors in the redemption of these regions. In the plains of Sharon, Esdraelon, Hauran, Bekaa, etc., modern agricultural machinery has begun to appear, and I am glad to report that most of it is of American make.

"Previous to 1902 American plows and reapers were operated in the Haifa neighborhood (upper Sharon) under the auspices of the American and German members of the Temple Colony. In the Bekaa (Coele-Syria) a Jesuit missionary organization conducted a 'model farm,' on which was employed a limited variety of French machinery. In certain Jewish colonies modern machinery was experimented with, but as they were subsidized by foreign capitalists work was largely perfunctory. It was not, however, until 1902 that natives of Syria and Palestine began using machinery in tilling the soil and in harvesting the crops. From now on the use of agricultural machinery and modern implements will grow steadily here, and there seems to be no reason to doubt that American manufacturers will control the market. Reapers, thrashing-machines, grist-mills and wind engines come from the United States."

Record Beaten in Exports of Manufactures.

AMERICAN manufactures exported in February of this year were greater in value than in any preceding February, and formed also a larger per cent. of the total exports than in any preceding February. For the eight months ending with February the total manufactures also exceeded the total in the corresponding eight months of any earlier year. The fiscal year 1900 was the banner year in exports of manufactures from the United States, but from present indications the fiscal year 1904 will show an even larger total of manufactures exported. The month of February shows a total of \$38,000,000 worth of manufactures exported, against \$34,000,000 in 1900, while for the eight months ending with February the total is \$288,000,000, against \$268,000,000 in the same months ending with February in 1900.

In the eight months for which a record is already made the total exceeds by \$20,000,000 that of the highest record previously attained—that of 1900—while the fact that February, 1904, exceeds by \$4,000,000 the figures of February, 1900, also indicates that the increase noted in the earlier months of the year is continuing in the latest available months, and thus likely to carry the year's total considerably beyond that of 1900. Not only in the grand total of manufactured exports does February exceed that of the corresponding month in any preceding year, but the percentage which manufactures form of the total is also larger than in the same month of any earlier year.

New York the Candy Center of the World.—It has been stated recently that candy costs the people of the United States about \$150,000,000 a year. New York is preeminently the candy city of the world. It has more establishments engaged in its manufacture and more stores handling it than any other city on earth. The output of England, France and Germany is not as large as the output of the United States, and probably New York city alone produces more than either one of the three countries alone.—*American Industries.*

Growth of American Industrial Corporations.—A compilation by the *New York Journal of Commerce* of dividends announced by American industrial corporations, payable in April, shows an increase of more than \$2,300,000 over the same month in 1903 and of about \$2,100,000 over April two years ago. The total, based on the returns so far, foot up about \$22,200,000. This shows the solid basis upon which our industries are planted.

ESTABLISHED 1846.

ESTEY ORGAN COMPANY,

Brattleboro, Vermont, U. S. A.

Cable Address: "Estey," Brattleboro, U. S. A.

Builders of High-Grade Organs and Pianos

Over three hundred and fifty thousand (350,000) in use throughout the civilized world.

The **Estey Reed and Pipe Organs** are specifically made for use in churches, chapels, music and lecture halls, Masonic lodges, schools and residences.The **Estey Pianos** are made in several styles of Upright and Grand.

Our Catalogue, illustrating and describing the various styles of Organs and Pianos made by us, mailed postpaid to all parts of the world.

None but the most skilled workmen and the best of material are employed in the making of the **Estey Organs and Pianos**. Prices quoted F. O. B. cars at New York City. Specify "Estey," and when ordering, to avoid errors, please mail us a duplicate of order.**NOTE.**—To facilitate the handling of our export trade we desire to communicate with one responsible musical instrument dealer in each trade center of the world.

ESTEY PIANO. Style 20.

Made in mahogany, oak and American walnut. 7½ octaves, scale A to C. Height, 4 feet 3 inches; Length, 5 feet; Depth, 2 feet 3 inches; Weight, boxed, 850 pounds.

ESTEY ORGAN. Style "S."

Solid walnut or oak case. Height, 6 feet 8 inches; Breadth, 3 feet 10 inches; Depth, 1 foot 11 inches; Weight, boxed, 400 pounds.

Chicago's Novel Underground Freight Railroad.

AN interesting illustrated article is printed in *Popular Mechanics* concerning the underground railway which is being installed in the city of Chicago, which city is the metropolis of the inland of the United States. As told by the writer in this periodical, the effort to relieve congestion is made with a liberal expenditure of American energy, much money and with prospects of the usual good results. The writer says:

Forty feet underneath the city of Chicago is being built a freight railway system, which, primarily, will handle 50,000 tons of freight daily, and ultimately 300,000 tons daily. The system at first will be twenty miles in length and will honeycomb the principal business streets, connecting all the depots, freight houses, hotels, office buildings and business houses. The freight cars will run into the basements of the big buildings, each basement being a miniature freight depot, provided with switches and other facilities for loading and unloading freight.

The freight railroad is being laid in the great system of tunnels underneath Chicago's streets. It is now proposed that another tunnel be dug above this tunnel for the construction of underground passenger railways to relieve the streets of the congestion of passenger traffic. Thus, if this latter scheme is carried out, Chicago will have avenues of traffic from three to five stories high. Forty feet underground the freight cars will travel; immediately above these underground cars will carry passengers to and fro; the surface cars will perform their usual duties on the street level; the river above the tunnels and below the car bridges will have its accustomed amount of boat traffic, and above the river the cars will speed along the elevated roads. Probably the next step will be to build a two-story elevated road, with cars running above those on the present elevated system and six stories above the freight line, which is two stories underground.

The Chicago underground freight railway will be unlike anything ever before attempted by any city in the world. Its object is to expedite the delivery of freight, to aid the cramped railway terminal facilities and to relieve the congestion of teaming on the streets, which is rapidly growing intolerable. Seven million dollars have already been spent in constructing the tunnel.

The work of building the railroad is progressing rapidly. Already three miles have been constructed, and two electric locomotives and twenty-four steel cars are in operation. The Illinois Tunnel Company, the owners of the project, have let the contract for 3,000 steel cars and 100 electric locomotives, to be in operation June 1st. The freight cars will be employed in hauling every kind of freight, including coal and all kinds of merchandise. The electric locomotives will have a capacity of 250 tons each on the level and of 100 tons on the inclines, which are to be used in connecting the railroad yards and buildings with the tunnel. The cars will each hold twenty-five barrels of sugar, flour or general merchandise or seven tons of coal.

One of the most valued services of the underground freight railway will be in relieving the cramped condition of the Chicago railway terminals. It seems that the railroads exercised very little foresight in their construction when they built them. Forty per cent. of the total railway mileage of the United States has terminals in Chicago. Thirty-eight great railroads and railroad systems have their terminals there, and these thirty-eight are compelled to receive and deliver their freight from a mere half-dozen freight depots.

At present more than \$50,000,000 is spent yearly for trucking freight across the city of Chicago from freight terminals to warehouses and stores. The cost to merchants averages about 90 cents per ton. With present facilities it is about the limit of capacity for a team to haul two truck loads of freight on a business day from any one of these depots. Under the tunnel system many times as much freight can be delivered and at a smaller cost for truckage.

How Electricity Is Replacing Steam.

AMERICAN machinery is coming into use everywhere throughout the world, and announcements are continually being made of important steps in the development of electricity as a motive power in place of steam. The *New York Tribune* in an article on the subject gives some interesting information: Another English railway has changed its motive power. It was formerly operated by steam. Now it is run by electricity. The line reaches northward from Liverpool to Southport, a distance of something like eighteen or twenty miles. Active steps for equipping it with the third-rail system began almost exactly a year ago, and the conversion was virtually completed before the close of 1903. Service was not initiated, however, until a few days ago. Trains are made up like those on the Manhattan elevated roads in New York City, partly of motor cars and partly of trailers, though only two of each kind are required at present. When a train reaches either end of the line no switching is necessary to bring the engine to the head. It is only necessary for the motorman to walk to the other end, move two or three electric switches and everything is ready for a return trip.

Two marked improvements have resulted from the change. The same thing was noticed in New York when electricity replaced steam on the elevated roads, but not to the same extent. Formerly there were seventy-four trains a day each way on the division reaching to Hall's Road, which is only $7\frac{1}{4}$ miles from Liverpool, and thirty-six went on to Southport. The number does not look large, but it taxed the facilities of the company to the limit, and that is why the change was made. Now 119 trains run to Hall's Road, and sixty-five of them continue to Southport. In other words, the capacity of the line has been multiplied about 70 per cent. The other gain is in speed. Trains that stopped at all stations formerly needed fifty-four minutes to make the run from end to end. Now they do it in thirty-seven minutes. With a solitary excep-

tion, the expresses took thirty minutes, and now they do it in seventeen. Formerly there were only two or three expresses each way daily, and now they run hourly.

The first English company operating a steam road outside of London to make even a limited use of electricity was the Northeastern. The old motive power is still retained for most of the system, but a large suburban service in the vicinity of Newcastle-on-Tyne is now conducted by electricity over a section of track laid years ago. The Liverpool and Southport is really a local line, and hence the conversion is complete instead of partial. In some ways, however, the action of the Northeastern company is the more significant. Pioneer enterprises demand greater sagacity and courage than imitations.

In the meantime the spirit of progress has been manifested in France, too. Not only is there an underground electric road in Paris, but electricity has displaced steam on one of the old roads running out of the French capital. When a new terminal station was built on the Quai d'Orsay, four or five years ago, electric locomotives were adopted to haul trains thither from the old station near the city limits, three miles away. So well has that experiment worked that the same means are at present employed to haul suburban trains to and from Juvisy, fourteen miles off. The extension is a small one, to be sure, but it is suggestive. There is no telling how much further it will go, nor how great an influence it will exert on the managers of railways in other parts of the country.

New American Plan for Training Mechanics.

I THOROUGHLY believe that it is the duty of every manufacturer to do his utmost to educate competent workmen through the apprenticeship system, but on account of the peculiar conditions obtaining in manufacturing in these days, the range of work in the shop is not always great enough to educate apprentices properly. I therefore hold with Professor Sweet that there should be "shop schools" established by the various trades—for instance, that the National Founders' Association should establish one or more schools in different parts of the country, under the direction of a properly constituted committee, this school to be supplied with work, from the different members, in such proportions as are suggested by the committee, the members sending the work to pay therefor at such rates as will assure a profit for the school, or, not being able to do this, to make a money contribution.

Undoubtedly as organized labor is now conducted, there would be much opposition to these schools, but this is a matter which should not deter the manufacturers. It seems to me there are only two questions to be decided in this matter, viz.: "Is it right?" and "Is it good business?" If so, then the manufacturers should forward the work and advocate the idea, as they have had in the past to introduce many advanced ideas and improved institutions, against the opinions of organized labor. They should press the policy with all the vigor at their command, with the certainty that in the long run the plan will succeed and the benefits inure to the fraternity.

Such schools as this would be of great advantage to each trade in many ways known to every manufacturer, outside of simply turning out competent workmen, and it is my belief that the establishment of such schools cannot take place too soon.—*P. W. Gates, in The Engineering Magazine for April.*

Improvements in Equipping American Machines.

ONE of the little niceties that go to make up a well-designed American machine are the dust-proof oil-hole covers which are coming to be adopted by manufacturers of nearly all types of machines, replacing loose plugs or caps, or bare oil holes having no covers at all. These devices not only locate the oil holes for the operator, and make sure that no oil hole will be overlooked, but prevent the holes from becoming clogged, conduct the oil to the right place, keep out dust from the bearing, do not become lost, and are directly responsible for a longer life of the bearing. Such covers have been particularly applicable to machine tools, where accurate fits and alignment are necessary, and to automobiles, where dust works into bearings so readily. We find, also, that builders of paper machinery, printing machinery and woodworking machinery are also utilizing covers of the same description because of the superior finish and evidence of attention to details given by such devices to their products.—*Machinery.*

Education and Industry.—An officer of an American pumping engine company was recently asked whether college men or men trained by practice are better equipped for industrial work. He replied: "Everything being equal, the practical man is likely to know more than the technical man about actual shopwork, but he is also likely to stop knowing when he should go on knowing." This feeling is general. The old-time apprentice, who developed into an all-around mechanic, is being rapidly ousted by the modern technical graduate who is a specialist. Even the modern foreman in America is no longer the product of apprenticeship. The trade school creates him.—*World's Work.*

Traction Engines for Brazil.—An American firm has secured a contract for 100 large traction engines and sixty-five of the biggest separators, equipped with self-feeders, recleaners and other special attachments for shipment to Buenos Ayres. The value of the contract is reported to be in the neighborhood of \$350,000. It is claimed to be the largest ever received for this class of machinery for shipment to one port.

American Sawmill in Britain.—An English journal says a firm of timber merchants has a new band sawmill at Newcastle-on-Tyne. The band mill is of American make and is operated by electricity.

TARR & WONSON'S COPPER PAINT

For Wooden Vessels' Bottoms, prevents boring of worms and all marine growth.

Awarded Eight Highest Medals:

Gold, Silver and Bronze.

Excels on Every Point.
Cheapest to Use in the End.

TESTIMONIAL.

NEW YORK, Aug. 3, 1903.

Messrs. Tarr & Wonson, Ltd., Gloucester, Mass.

Gentlemen: It affords me great pleasure to comment to the credit of your copper paint.

I used your paint on my vessel here December 10, 1902; bottom in poor condition for good coat-damp; remained at the dock here forty-nine days; thence to New London, Conn.; thence to Cay Frances, Cuba, where we remained at anchor in only 18 feet water—water very warm—for eighty-seven days; thence back to New York, when I hauled on dock for painting again, July 5, 1903. I found the surface clean and clear of sea growth of every nature, hence my relative feelings toward your product is, beyond doubt, to the head of the list to stand the severe test as it did of the shoal, warm, clear Cuban water, and I claim its outfit is complete. Yours very truly,

(Signed) A. A. LOWELL, Master Sch. Edward H. Blake.

NEW JERSEY PAINT WORKS,

HARRY LOUDERBOUGH, Proprietor,

JERSEY CITY, N. J.

U. S. A.

Remarkable Fact.

This cut is a copy of a photograph of a board having one end painted with **New Jersey Copper Paint**, manufactured by Harry Louderbough, proprietor of NEW JERSEY PAINT WORKS, Jersey City, N. J., U. S. A., and placed in the water at Port Royal, S. C., for five months. Upon the unpainted end you can note the ravages of the salt-water worm so destructive to wood, and also the large number of barnacles that have fastened upon it. Observe the painted end, where **New Jersey Copper Paint** was applied—its splendid condition.

A PAINT THAT PROTECTS.

The board here represented was placed in the water at Port Royal, S. C., by me, and left in the water five months. The painted end was as good as when it was placed in the water.

THE GENUINE "O.-K." WASHER.

KNOWN AND IN USE THROUGHOUT THE CIVILIZED WORLD.

The O. K. is the KING of ROTARY WASHING MACHINES! Because:

1. The O. K. is the only Rotary Washer that has Revolving Steel Ball Gearing, reducing the friction and thus making the machine so light running and almost noiseless.
2. The tub is made of Louisiana Red Cypress lumber, and corrugated similar to a washboard. The legs are made removable, and are packed inside of the tub, as are all of the castings.
3. The wheel turns right or left, pin-wheel or dasher reverses automatically, turning the clothes back and forth through the hot soap-suds, and cleaning them without rubbing them to pieces.
4. The O. K. Washer is made by experienced mechanics, and will outlast any other washer on the market.
5. The tub has a wringer box, fastened with steel brackets.
6. The lid on tub closes tight, no escape of steam.
7. Has gilded hoops, castings and name.

Prices quoted F. O. B. New York. Each O. K. Washing Machine, crated, ready for transportation abroad, weighs about ninety (90) pounds, and occupies nine (9) cubic feet.

OUT-HATCHES ITS COMPETITORS!

Why does the Reliable Incubator give such remarkable results—hatching 85, 90, 95 per cent. of the fertile eggs? Because our heating, regulating and ventilating systems give pure, vitalizing oxygen to germ and growing chicks. Other reasons why the Reliable is a profit-bringer are its durability, and economy of time and material. It has double top and bottom, made of best kiln-dried lumber, so treated as not to absorb moisture.

Reliable Incubators

have trays so constructed that it's easy to reach either eggs or chicks. Remember, too, that the Reliable out-hatches its competitors so often because the heat in corner or center is always the same temperature—a mellow, even heat in every cubic inch of the egg chamber. Our new catalogue is free. It tells a lively story giving warnings, and simple, yet full instructions on hatching and raising poultry successfully. Just send 10 cents to pay postage

RELIABLE INCUBATOR & BROODER CO., Box A 000, Quincy, Ills., U. S. A.

"SUVLIGHT," THE LIGHT OF THE AGE.
Patent No. 738160—150 candlepower—saves 80 per cent. of gas and gives a beautiful electric effect.

Never Blackens Mantles.

Incandescent Burners, as generally constructed, give much annoyance and trouble always to get the exact mixture of gas and air to make the most effective combustion, but with "Suvlight," by the simple movement of the thumb, the exact proportion of gas and air and the highest possible illumination are instantly obtained. Adapted for all kinds of lamps, mantles and any variation of gas pressure. It is the long-felt want in private and business houses. Write for lowest export prices.

"SUVIO" GAS HEATERS

Introduced Into the Whole World. Good for All Seasons, "Suvio" has stood the test of time. Name "Suvio" and Patent Nos. 571916, 27376, 573205 stamped on top of each heater. If you handle similar heaters be sure they are not infringements, and thus render yourself liable for damages. "Suvio" is the real thing—better and cheaper.

SUVIO HEATING AND LIGHTING CO.,

1079 Third Ave., 40 West Broadway and 59-61 Park Place,

A HATCHING WONDER

The new CYCLE HATCHER. An entirely novel method of hatching and brooding chicks. Requires only the self-supplied moisture of the egg itself. No egg-tray doors to open. Regulation automatic and exact. Holds from 50 to 10,000 and can be set with 50 or more eggs per day, making it unnecessary to fill entire machine at starting. Eggs cooled without removal from machine. Will hatch hens, ducks, geese and turkey eggs equally well at the same time. Made entirely of metal and asbestos. Is fire-proof and will not warp, swell, shrink or crack. 50-egg size, 7 x 17 1/2 inches; weight, 12 lbs. Net price, \$5.00. For full particulars address

TO ADVERTISERS.

THE AMERICAN EXPORTER is the only *independent* and *impartial export paper published*. It is *independent* because its publishers are not engaged in any other branch of the export business. They are neither export commission merchants nor manufacturers' selling agents, and hence they are under no more obligations to one advertiser than to another.

It is *impartial* because it treats all its patrons alike. It cannot, for this reason, and it does not, publish write-ups or puffs of any specific make of goods, no matter whether advertised in it or not. It charges the same price for the same services to all alike.

We desire it distinctly understood by those who contemplate advertising in THE AMERICAN EXPORTER that space for advertising purposes is sold only upon the merits of the publication for that purpose. For this reason no advertising solicitor or agency has any right or authority to agree to give reading notices or to perform any special service whatever to obtain orders for advertising.

We make it a practice not to discuss the merits or demerits of other export trade papers. Comments on their value may be made with more propriety by those advertisers who have had experience in the use of such publications.

Softens and Preserves.
Prevents Mould,
Does Not Scale Off.

The No. 7 Hardie Painting Machine

Does the work of twenty men with brushes,
and does it better.

The No. 7 Hardie Painting Machine comprises a patented brass pump with brass ball valves, ingenious agitator and paint mixer, contained in a 30-gallon barrel, mounted on wrought-iron wheels, 26 inches in diameter, with 1½-inch tires, and is as easy to wheel as a baby carriage. It is equipped with 10 feet of high-grade ½-inch hose, long extension rod and special disgorging painting nozzle.

It will save its cost in a few hours' use.
Will spread any liquid of a sprayable nature.

SPECIAL OFFER FOR EXPORT ONLY:

Upon receipt of \$17.50, U. S. gold or its equivalent, we will box and deliver at New York City one No. 7 Hardie Painting Machine complete. Weight, 110 lbs. Packed in two cases—one, 9 cubic feet; one, 7 cubic feet.

We refer to 30,000 satisfied users of our machines.

The "Stay-There" Ready-Mixed Cold Water Paint

is composed of minerals ground in a liquid chemical, to be thinned with water. Packed in tight, iron-hooped barrels. IT IS AS DURABLE AS OIL PAINT; will not chalk or peel off; is fireproof, waterproof, washable and sanitary.

Upon receipt of SIX DOLLARS we will deliver f. o. b. cars at New York City ONE HUNDRED GALLONS of WHITE "STAY-THERE" PASTE PAINT. Gross weight, 400 lbs.; barrel, 28x28x20½ inches.

Our 1904 Catalogue, illustrating and describing the largest line of Painting Machines for every purpose, and the "Stay-There" Paint, will be mailed free to any part of the world. We will open accounts with responsible importers furnishing American references. Orders accepted through New York commission houses.

Rice and Coffee Hulling Machinery

Improved Rice Huller and Polisher.

OUR RICE HULLER

Is the only machine that will take rough rice and in one operation make it merchantable. For simplicity, durability and economy has no equal. They are used on plantations, and also in the largest mills. Both the Coffee and Rice Hullers are made of iron and steel, and can be knocked down and packed for mule transportation if desired.

OUR COFFEE HULLER

Will hull pulped or cherry coffee without breaking or leaving unhulled a single grain. The products will come out clean, polished and free from hulls, ready for bagging, all in one operation. It is the Only machine that will grind the hulls fine, so that they may be sucked by the blower through the screen underneath the machine, leaving every grain of coffee inside of the machine, no matter how small it may be.

Latest Engelberg Coffee Huller.

LUNKENHEIMER REGRINDING VALVES

Made of Gun Metal are unsurpassed where thorough, reliable service is the first requisite. In screw and flange ends, for 200 and 350 pounds working pressure, from one-eighth inch up.

A trial order demonstrates their peculiar fitness and invariably results in their adoption. These valves are extensively used and in continuous service in the United States Navy, Locomotives, Lake and River Boats, High-Pressure Power Plants, Etc. All valves rigidly inspected and tested before shipment.

Specify LUNKENHEIMER Make and order from your export agent. Write for Catalog of Brass and Iron Steam Specialties and Engineering Appliances of superior quality.

Stockroom: No. 7 Lafayette Place, New York.

DIETZ Nos. 30 and 60 TUBULAR SEARCH LIGHTS.

These lamps are made for outdoor or indoor use. They give a powerful and brilliant light, and are not affected by the wind.

They are suitable for use in mills workshops, warehouses, stables and summer resorts, or in any other place where a good light is required which will not be affected by strong breezes.

Where it is desired to light up a long row of animals or a long, narrow room of any kind, these lamps are especially desirable.

No. 30 is fitted with our patent bull's-eye lens on perforated plate, adding to the appearance of the light.

No. 30 has a blizzard globe, 1-inch wick and a bright tin reflector 12 inches in diameter. Price, \$30.00 dozen.

No. 60 has a No. 2 globe, 1 1/4-inch wick and a bright tin reflector 16 inches in diameter. Price, \$72.00 dozen.

We are pleased to send complete catalogues (Spanish or English) and price list to those interested.

"The White Lily Washers, Wash Lily White."

Such is the verdict of thousands of users throughout the "States" of the

White Lily Washer.

WHITE LILY WASHER.
WASHES LILY WHITE.

The White Lily (Rotary) Washer is made from Louisiana and Mississippi Red Cypress, which is less susceptible to expansion and contraction caused by hot or cold water than any other timber known. Our hinges are put on with bolts instead of screws, and every part is reinforced wherever necessary, thus making the

Most Durable Washing Machine Made.

By the use of a HIGH-SPEED ROTARY WASHING MACHINE you can create a soap-suds or foam without having to turn the fly-wheel so fast that the SPEED, rather than the work, tires the operator.

The speed of the White Lily Washer is 2½ turns of the fly-wheel to one turn and return of the dasher. The White Lily Washer is the Highest-Speed Rotary Washing Machine made. Will create more soap-suds with less exertion, and will wash clothes cleaner than any other known washing machine.

Special Offer to Introduce Abroad:

Upon receipt of **Thirty dollars** (\$30.00) in U. S. gold or its equivalent we will box, ready for transportation abroad and delivered F. O. B. cars at New York City, **Six (6) White Lily Washing Machines.**

It is fitted with two wooden shelves, 10 and 14 inches in width, on nickel-plated, adjustable shelf brackets.

SPECIAL EXPORT OFFER.

Upon receipt of \$42.00 in U. S. Gold (or its equivalent), we will box, ready for transportation abroad, and deliver F. O. B. New York City, one of our No. 31 Show Cases as shown. Net weight, 248 pounds; gross weight, 384 pounds. K.-D. for export measures 28 cubic feet.

Our Catalogue, illustrating and describing the various styles and sizes of K.-D. Show Cases manufactured by us, mailed postpaid. Orders received direct or through export houses. When ordering through the latter, to prevent errors, please mail us duplicate of order.

Grand Rapids Fixtures Co.'s Show Case No. 31

GRAND RAPIDS FIXTURES CO., GRAND RAPIDS, MICH., U. S. A.

BALKE MANUFACTURING CO.,

Patentees and Manufacturers of

Balke Combination Davenport, Billiard and Pool Tables, and Standard Tables.

INCORPORATED \$100,000.

Style "A," as a Davenport.

No home or club is thoroughly equipped unless it contains either a Davenport or Standard Billiard or Pool Table or Combination Billiard and Pool Table. We make both, of the highest grade and of the highest quality.

Note—The prices here quoted, U. S. Gold or its equivalent, are for Foreign Markets Only, and include boxing ready for steamer, delivered f.o.b. cars at New York City.

Style "A," as a Davenport, is made of quartered sawed oak covered with N. Y. leather, and, as shown, is a handsome adjunct to a parlor or clubroom.

Style "A," converted into a Billiard or Pool Table, has a playing surface of 3½x7 feet; has 6 polished maple cues, and 4 genuine ivory billiard balls for billiard table and 16 best quality composition balls for pool table. Price complete, \$95.00. Gross weight, 800 pounds; net weight, 650 pounds. Size of boxes: 4'x8'x6'; 32'x36'x6'.

Standard Billiard Tables.

"Benedict" Special is the best table for the price ever offered. The bed is of Vermont slate imported billiard cloth; cushions are made of the best rubber. Furnished with 12 polished cues and 4 genuine ivory billiard balls. Size of playing surface is 4x8 feet. Price complete, \$125.00. Gross weight, 1,240 pounds; net weight, 920 pounds. Size of boxes: 4'2"x8'2"x8'; 4'x8'2"x2'.

"Den" Special is just the table for the den; made of oak, while the bed is of Vermont slate; furnished with 6 polished cues and 4 genuine ivory billiard balls. Size of playing surface, 3½x7 feet. Price complete, \$90.00. Gross weight, 700 pounds; net weight, 500 pounds. Size of boxes: 4'x8'x8'; 3'6"x6'x2'.

Orders received direct or through export houses. When ordering through the latter, to avoid errors, please mail us a duplicate of your order. Our catalogue, illustrating and describing the various styles of Billiard and Pool Tables manufactured by us, mailed postpaid.

Style "A," converted into a Billiard Table.

Benedict Special Billiard Table.

"Den" Special Billiard Table

BALKE MANUFACTURING CO., Grand Rapids, Mich., U. S. A.

White Enamel Refrigerator Co.,

ST. PAUL, MINN., U. S. A.

Owners and Manufacturers of

Bohn's Patent Dry Air Syphon System of White Enameled Refrigerators.

The Bohn Dry Air Syphon System insures a low and uniform temperature, ranging from 38 to 48 degrees Fahrenheit. With our Enamel Lining, you need only to wipe the food compartments with a damp cloth to clean perfectly. The only absolutely sanitary refrigerator made.

Adopted and used exclusively by the Pullman Company for all of their Dining and Buffet Cars. Pennsylvania Lines, New York Central, Michigan Southern, Union Pacific, Canadian Pacific and all other railways throughout "the States" and Canada as well as by thousands of homes, hotels and clubs.

For Foreign Markets Only.

The prices here quoted includes boxing ready for transportation and delivered F. O. B. cars at New York City.

No. 2. Style "A," Panel Door. Price, \$23.00. Outside measurements (inches): Width, 38; depth, 21; height, 44. Weight, boxed, 278 pounds.

No. 5. Style "D," Upper Door Glass. Price, \$49.00. Outside measurements (inches): Width, 48; depth, 26; height, 66; weight, boxed, 540 pounds.

NOTE—Orders received direct, or through export commission houses. When ordering through the latter, to avoid errors, please mail us a duplicate of order.

Our forty-page catalogue, illustrating and describing the various styles of White Enamel Refrigerators made by us, mailed postpaid.

No. 2. Style "A," Panel Door.

No. 5. Style "D," Upper Door Glass.

MICHIGAN BARREL CO.,

Grand Rapids, Mich., U. S. A.

MANUFACTURERS OF

HIGH-GRADE REFRIGERATORS.

None but the most skilled mechanics are employed, and none but the highest grade of material enters into the making of our refrigerators.

SPECIAL SAMPLE ORDER FOR EXPORT ONLY:

ECONOMIC REFRIGERATOR No. 204.

Solid Ash; Insulated with Charcoal Sheathing and Mineral Wool; Patent Adjustable Shelves; Zinc-Lined; Economy in Ice; Perfect Circulation. Net weight, 155 lbs. Gross weight, 240 lbs. Outside measurement, 38x19x42 ins.

PRICE, f. o. b. New York, \$13.60.

CHILKOOT REFRIGERATOR No. 0103.

Made with Hardwood, Golden-Oak Finish; Insulated with Charcoal Sheathing. Net weight, 135 lbs. Gross weight, 210 lbs. Outside measurement, 30x20x45 ins.

"The Best Low-Priced Refrigerator on the Market."

PRICE, f. o. b. New York, \$9.40.

NOTE—Our catalogue, illustrating and describing the various styles of REFRIGERATORS made by us, mailed postpaid.

Chilkoot Refrigerator No. 0103.

Economic Refrigerator No. 204.

CULTIVATION OF COTTON.

MANUFACTURERS of cotton plantation machinery are likely to benefit from the recent heartbreaking corner in that product, and American firms engaged in that branch of trade will do well to study the drift of foreign effort in that direction, for in this particular line American machinery has not been either equaled or excelled by any other nation's inventors. This is a point that should also be borne in mind by any of our readers who contemplate embarking in the cotton-growing industry. Aside from good machinery, a careful study of climate and other conditions is necessary, and we would advise quite as much care in that direction as we would suggest in the selection of machinery. It is a situation where our foreign friends and our American manufacturers can get together to the advantage of both parties to any transaction that may occur.

The chief essential in the growing of cotton is to secure a proper location, but after that the economy of operation and the consequent profits come chiefly from the use of improved mechanical methods of handling the commodity. In this direction American inventors have achieved distinct successes, and they have succeeded in simplifying the work to a degree that has greatly increased the legitimate profits of the growers in the cotton belt of the United States. We do not advise our readers to take up the industry unless they have or can obtain expert knowledge of it, for the recent cotton corner has caused so many to take up the idea that those who go into it are not likely to find such attractive prices or such great profits as would seem possible from recent market figures.

Americans in the cotton belt are going to take up the cultivation to a greater extent than ever before, but people who live in cotton-growing zones in other countries and operate intelligently with the best American methods have no good reason to hesitate about embarking in a business that will yield reasonable profit, if carried on under the guidance, or with the advice of competent persons, aided by the mechanical devices which American manufacturers can offer.

SULLY, the so-called American "cotton king"—we have no kings or queens in the United States—has been trying to extricate himself from the miserable predicament into which he has fallen through endeavoring to make a fortune at the expense of other people. Sully blames two or three alleged confederates, who he claims deserted him at a critical time, for his failure in business. Some of his creditors have been endeavoring to learn the truth of his story, but for the purposes of the welfare of trade generally the American public will be heartily pleased to have Sully and his associates relegated to the rear. Sully is one man in 80,000,000 of people. It is doubtful if there is another who would plan to ruin a great industry, affecting so many people here and elsewhere. The American public would prefer that a man of his kind be left out,

and that the population figures be made 79,999,999. Perhaps, after all, Sully was born on some isle that no nation owns, or would care to own.

WE have received a copy of the full report of the Mosely Commission, which came from Great Britain to the United States last year to study conditions in America. The report is a volume of 400 closely printed pages. We have heretofore had occasion to comment upon the conclusions of the commission, and there is little new in the detailed account of the investigation of our visitors which calls for further remarks. It is worth noting, however, that the commission "is of opinion that while in the past the belief in education has been the effect rather than the cause of American prosperity, yet during the last quarter of a century it has had a powerful and far-reaching influence, and that in the future it will become more and more the cause of industrial and commercial progress and of national well-being, and will materially affect the conditions hedging about commercial competition with Great Britain."

ANDREW CARNEGIE'S latest effort toward uplifting and relieving humanity has taken the form of a fund of \$5,000,000, which is intended to prevent heroes and their families from suffering through lack of appreciation by the beneficiaries of their deeds of valor. Medals are provided for, and more substantial provision is made for men or women who risk their lives, or for the dependents of heroes and heroines, in case the latter do not survive. Ordinary every-day acts of heroism are quickly forgotten, and it frequently happens that those who risk life and limb for others and sustain injury have to suffer through the thoughtlessness of others. Mr. Carnegie's fund is a wise provision against such instances.

AMERICA now has three cities containing populations of over 1,000,000 each and fourteen cities in the United States have more than 300,000 each. Of course, New York heads the list, with 3,716,139 inhabitants. Philadelphia and Chicago are the other two great cities, their populations being between one and two millions. The total population of the United States at present lacks very little of eighty millions, a gain of nearly four millions in three years, which is certainly evidence that the growth of the country's business interests is upon a substantial foundation, for the increase in population will naturally enlarge the demand made by consumers in the future.

FRANCE and Great Britain are both to be congratulated upon the successful negotiation of the Anglo-French colonial treaties. The treaties settle many points which might easily become sources of annoyance in the relations of the two countries, and the event can be called an important step in the direction of universal peace—at least it is so regarded in America.

AMERICAN steel is said to be regarded with favor by the Italian Navy Department. The steel manufacturers of Italy combined some time ago to raise prices on account of being unable to supply the demand in that country, and we understand that American manufacturers are invading what seems to be a promising field.

JAPAN'S trade with the United States, according to a report issued last month by the Department of Commerce, has been growing rapidly in recent years. Without going into figures, it appears that of the five principal countries with which Japan has commercial dealings, the United States has made greater gains than any of the others.

PHILIPPINE trade seems to keep pace with that of the United States and its other dependencies. In the last reported eight months the gain was \$6,000,000 over the corresponding previous period.

SIAM is one of the latest countries to appreciate the worth of American goods, and has invited bids from our manufacturers for furnishing large quantities of railroad equipment.

BIG NAVY—WAR DETESTED.

AMERICA now leads in new battleships, according to figures presented to the British Parliament by the Secretary of the Admiralty, who says that the total tonnage of battleships now building and projected is as follows: The United States, 209,180; Great Britain, 187,000; Russia, 125,270, and Germany, 103,976. The American program of naval increase is based upon the desire for peace that is a dominant element of our civilized life. We would rather spend the money in advancing the trade of the world, instead of creating an enormous establishment whose chief effective use would be one of destruction of property and life, but perhaps the money is being well spent. It is nevertheless a fact that the bulk of American people would prefer to see the money used in the interest of higher education, the uplifting of the masses, the rewarding of discoverers of important benefits to mankind and the general elevation of the human race without regard to locality or previous condition.

The best fighters in the United States are men who deplore physical fighting. The most progressive men are opposed to armed combats, but it is characteristic of the nation that while conflicts are to be avoided whenever possible, it is not proper to suffer personal loss or submit to indignities. The real American never "bluffs," to use a slang expression, and he seldom asserts himself in a manner which might be mistaken for "bluffing" until it becomes absolutely necessary. His aim is to avoid trouble, rather than to seek it. His desire is for "peace, with honor," as an American statesman once expressed it. But, above all, whatever he may do, the real American wants to put out into the world the best product that his mind and machinery can turn out. If warships, he wants to have his country at the top of the list, and if it is in manufactures, either for home use or for export purposes, he desires to send to his customers articles that cannot be excelled by his competitors anywhere in the world. And he generally succeeds, for he puts his whole life and existence enthusiastically into whatever he does toward making the world more prosperous, thinking perhaps less of himself personally than he does of others, because he knows that he will share the rewards which are sure to come from his efforts when intelligently directed.

QUESTION OF CREDITS.

ONE of the most interesting and important features of the trade between American merchants and their patrons in foreign lands is the question of credits and the adjustment of prices for products, particularly in cases where there may be some slight difference in the market valuations of the moneys of the respective nations of the seller and the purchaser. These inequalities are satisfactorily adjusted with hardly an exception in the ordinary course of settlements. As to the question of credits there will always be a wide divergence of opinions. It seems only natural that an agent should feel that he ought not to pay for a manufactured or other article until he has sold it. The agents or middlemen are more numerous than the manufacturers or other producers and their opinions, having more general circulation, are more readily accepted by the general public as being correct in principle and practical in operation. On the other side of the case the interests of the manufacturer must be considered. Why should he not be paid as soon as he has constructed a machine and has shipped it to its destination? The fact that the agent, the seller, has not yet realized upon the transaction does not alter the circumstance that the manufacturer has already paid for material and labor, except a modest margin of profit, the cost of making the article under consideration. In other words the manufacturer stands to gain only his small profit after expending very nearly as much money as he expects to receive eventually for the completed article, taking all the chances of entire loss through marine disasters or possible dishonesty. The latter seldom happens, but it is an element of risk that prudent American exporters are obliged to take into consideration.

No universal system of dealing with the question of credits in the export trade of American merchants has yet been adopted. Various plans have been suggested from time to time, but not one has yet been proposed that is applicable to our relations with all of the foreign

countries with which we do business, nor has any been discovered which is universally and satisfactorily applicable to more than one line of industry. This may seem remarkable to our foreign readers, unless they are dealing with several different countries in various lines of trade. Wise men have endeavored to formulate a system of credits that would be fair to American merchants and equally favorable to their foreign customers. In some branches of international commerce success has attended these efforts, but in others the result has not been so satisfactory.

There are some ideas in connection with the subject that we would like to impress upon our readers. American manufacturers of the present day do less business themselves upon credit than ever before in the history of the country. They buy for cash, or its equivalent, and they figure on doing a large business with a relatively small profit as to individual transactions. Credits to customers that would be unobjectionable in the domestic trade, by reason of the shortness of the maturing time, might work hardships in cases where the patron was weeks or months away from the exporter's establishment. With the small profits charged, in some cases the loss of interest would practically wipe out any profit at all on shipments. In American business life shrewd men are now aware that they cannot get something for nothing. They realize that if they get long credits from others they must pay for them somehow. In individual cases it does not require much inquiry to disclose that such is the case. In selling to customers in foreign countries American exporters give their patrons the advantage of our low and reasonable prices—based upon small profits—and expect in return that payments will be reasonably prompt. The credit element in American business methods, outside of monthly bills that are expected to be paid regularly and promptly, is passing into the background. It will not be many years before it will disappear entirely from the American wholesale business world. We are only interested in the subject to the extent of explaining the situation to our foreign readers in order to assure them that they are really benefiting by the trend of minimizing credits. They are getting better articles for less money than would be possible under the old system. After all, this is the test which American manufacturers are able to stand successfully; the best that is producible, with the price the lowest at which a living profit can be made. What more can the purchasers of American or other goods desire?

NEW ERA IN COAL MINING.

AMERICAN inventors have made such improvements in mining machinery that the old system of picks and blasting will soon be obsolete everywhere in America. Drills driven by compressed air or electricity now take the place of the picks in the hands of miners. Instead of blasting after drilling, there is a machine, operated by either air or electric power, which digs into and breaks up the loosened coal, loading it into the vehicles that take it to the hoisting shafts. Fewer miners are required, the production is greater, and the work is done under the improved conditions which exist in every field where American labor-saving machinery is used to its full advantage. In some of the American mines electricity is now the only motive force used, aside from the brain force used by the workers who direct the machines. In the famous Cripple Creek district electricity has already superseded all other kinds of power. In a recent article on the subject the *Engineering Magazine* makes this comment:

"Taking a comprehensive view of the influence that machinery brings to bear on the working of a mine, one is struck with the general idea of thoroughness of system and method that seems inseparable from its use, and which will undoubtedly have its effect not only in the attainment of greater economy in production, but also in the not less desirable result of lessening the danger to life and limb, and materially diminishing the number of accidents to which, alas! all mine workers are liable."

Our readers generally are not so much interested in mining machinery as they are in other sorts of American manufactures, but the progress made in mining machinery is worth calling to their attention as showing that our inventors are not limited in their improvements of machinery to the agricultural implement or any other particular field. They are as versatile as they are progressive.

BAD MONTH FOR WARSHIPS.

LOVERS of peace throughout the world found arguments aplenty last month to support their doctrine that war is full of horrors and should be abolished entirely by civilized nations. They also found arguments against the system of having great naval establishments in time of peace, for two nations engaged in the peaceful pursuit of internal trade and foreign commerce were called upon to see loss of life in their naval equipment which might only be expected in times of war. Just three seconds of time changed the British submarine A1 from a participant in strategic maneuvers into a steel coffin for eleven brave men. One second of time put in peril the new American battleship Missouri and killed thirty-two of her officers and men in practice firing with her big twelve-inch guns. On the Missouri over a ton and a half of powder burned, and only the heroism of one of the men, who died later, saved the big fighting machine from total destruction. This sailor, injured as he was by the explosion of the first charge, jumped into the ship's magazine and closed the door after him. When the magazine was flooded he came very near being drowned like a rat, but fortunately escaped that fate. The value of time was never better demonstrated in relation to life itself on water than in these two instances.

Russia and Japan are at war, and disasters are to be expected in the navies of both nations, but Russia's loss of the big battleship Petropavlovsk, with Admiral Makaroff and a crew of 600 men, was one of the most interesting arguments which lovers of peace found to put forward in support of their opposition to war generally. Whether sunk by the Japanese or not, whether destroyed by mines or by some traitor who had access to her magazines, it was pointed out that civilization ought not to longer tolerate conditions which can rob 600 men of life in a moment without any resulting benefit to the world at large. There will be more tragedies of the sea before this war is ended, but the object lesson taught by them will undoubtedly prevent the governments of the world from resorting to war until after every avenue of diplomacy and arbitration is closed to them. Some of our contemporaries expect to see all Europe involved in a worldwide war, but if it ever comes we believe it will be a unity of peacefully disposed governments to crush some power that is disposed to rush headlong into conflict with some other nation that recognizes diplomacy and arbitration as the proper means of settling international disputes. The time is coming when war can no longer disturb or interfere with international commerce.

AUTOMOBILES VS. RAILROADS.

A GIANT automobile has recently been made in America for a resident of the city of Cleveland. The machine cost \$35,000, the motive power is equal to 300 horses and the car possesses every known convenience for travelers. In fact, it is quite equal to one of the palace cars on the American steam railroads in point of accommodation and comfort. This automobile is believed to be the largest ever built and its operation will be watched with interest for many reasons. Its owner intends to take a party of twenty-seven friends with him on a long summer tour through the central portion of the United States.

The construction of this enormous vehicle leads a progressive man to make a query and answer it as follows: "Now that good roads are being built between the largest American cities why may it not be possible to have lines of giant auto stages, running at short intervals? In this way the monopoly now possessed by the railroads might be broken. The automobile stage would pay nothing for its roadbed, and might afford to carry its passengers for a cent a mile or less."

Our friend is altogether too progressive. His query and his answer are what one may expect from a man who is thoughtful and enthusiastic, but not practical. At the same time he exhibits a faith in the future of American automobiles that is both interesting and refreshing. For his benefit it may be said that an American inventor is at work on an idea that may, if carried out, fulfil his dream in part. This is an automobile wheel which is to be so constructed that when the tires are inflated the machine will run anywhere as

would an ordinary automobile, but when the tires are deflated a flange like that of the tram-car wheels will be available to take flat rails which the inventor proposes to have laid along the streets of cities and the roadways in the country districts. The expense of providing the tracks is a prohibitive objection to the inventor's plan and the wear and tear on the wheels which he would have to make of both rubber and steel would limit their use to pleasure purposes. For commercial purposes the idea is quite as impracticable as is the proposition that automobiles will ever supplant the railroad trains.

Fast American railroad trains now average over sixty miles an hour, freight trains average thirty miles and even on the elevated roads in New York City with stations sometimes only a quarter of a mile apart the trains gain a headway of twenty or twenty-five miles an hour. In the suburban districts electric trolley cars run long stretches at twenty-five or thirty miles an hour. Without the rails to guide the wheels such speed would be inconsistent with even the semblance of safety, either to the persons in the cars or to other persons who might be near the roadway. The most powerful brakes would not stop a car within less than its own length, and if they were applied with full force would pitch all of the occupants either out of it or against its framework with practically the same force and speed which was being made at the time of the application of the brakes. Serious accidents would be inevitable.

Expert automobilists, who are enthusiastic up to the point of doing injury to themselves or others, inform us that the limit of safety on ordinary roads is so low in point of speed that the automobiles can never be expected to replace steam railroads, or even the electric trolley cars. The automobiles are coming more and more into general use in America, as they are everywhere, Americans are constantly making improvements in the construction of the machines and the future of the industry grows brighter every day—but anybody who takes the trouble to peruse the reports of the American railroads and notes the many billions of tons of freight carried, who takes account of the hundreds of thousands of locomotives and railroad cars that are used, who pauses to take into consideration the steady and rapid growth of our trade, will realize that it is impossible for the automobile ever to replace the railroad trains. The automobiles are now made useful for the local distribution of freight and they are becoming more popular commercially in the shape of vans, trucks and drays, but for business purposes they are not likely to enter into trade activity beyond the field which they now occupy—certainly they will never be able to catch up with the big railroads, either in speed or in capacity for handling the vast quantities of American manufactures and other goods that are carried by the railroads of the United States.

QUICK and accurate work at the guns is cultivated and encouraged in the American navy. Some marvelous scores were made during the practice firing last month. The battleship Texas wrested the world's championship from the Wisconsin, for with her 12-inch guns her men scored in one string of shots 11 hits out of 12 shots in ten minutes. In the other turret a record of 10 hits in 11 shots was made, which is a better record than that of the Wisconsin. The gun crews of other ships made splendid scores.

ENTRIES are already being made for the great race for the International Cup, to be held on June 17th, under the auspices of the Automobile Club of Germany. The United States will be represented, and we understand that the authorities will endeavor to give the contestants the best possible protection, and that safety will be an important element of the contest, although there will be no prescribed rate of speed, which, in fact, there could not be in a contest of this description.

FLYING machine stories are more numerous than ever before, and the claims made by some of the inventors are so great that even the layman is apt to regard them with suspicion. On another page we print the views of Thomas A. Edison, one of the most practical inventors known to the world. Mr. Edison does not believe the time is quite near for commercial airships and we agree with his conclusions.

OUR LABOR-SAVING MACHINERY.

FRANK H. ROSE, a British labor man, has written an article on "The Effects of Labor-Saving Machines," which appeared in a recent issue of the *Engineering Magazine*. Summed up in his own words his conclusion is as follows: "I cannot find that machinery has increased either the worker's wages or his leisure. But it has enlarged his opportunities for the profitable use of both. It has given him cheap and rapid transit and has enabled him to engage in pursuits and to cultivate tastes which would have been inaccessible without its aid." If labor-saving machinery has done nothing more than our British friend suggests, it has accomplished a great deal, but, as a matter of fact, American labor-saving machinery has done very much more than he believes. It has in America—whether it has or not in Great Britain—resulted in shorter hours for work and in higher wages for the workmen who have displayed proficiency in the operation of their machines. American employers, as a rule, are not at all selfish and their workmen receive consideration which results in better products than would be the case if they were treated like anything else than ambitious, intelligent human beings.

We have no interest in the question of union or non-union labor. The great majority of the labor unions in America are so jealous of the ability of their members to perform their duties satisfactorily that union membership is a guarantee usually of competence and is so accepted even by employers who may not like unionism for reasons that are not germane for our present purposes. The point of it all is that in many American shops, which are "controlled by the union" of workmen of the particular industry concerned, the union scale is cast to the winds. This is not done in a way that hurts the union or injures the men. A prominent American manufacturer of agricultural implements in conversation with the editor of THE AMERICAN EXPORTER recently explained his methods of dealing with his employees. He is personally opposed to unions, but he realized that he could get better workmen who were union men than he could secure outside of the union. He has carried the matter further than union or non-unionism. He does not care which sort of brand he gets. The man *must* make good, whether he belongs to the union or not. The minimum pay in his establishment is the union scale—the highest pay is so much higher than the union scale that some of our readers might hesitate to believe the figures. In this establishment there are no strikes, the workmen appreciate their larger pay and they are so much more attentive to the interests of their employer that he secures better practical results. In a few sentences he summed it all up as follows:

"My company, before I came into control, had a great deal of trouble with the labor unions. As a subordinate I saw that there was a feeling of hostility toward the company on the part of the workmen which was reciprocated by the directors. I knew, as a subordinate, that the men could do better work if they were treated differently. When I took charge I found a decided improvement. I did not bother about the union end of the game, but I watched the reports, got around myself and saw what was going on. The man on machine 18 was the first one to notice anything. His machine handled some of the most delicate parts that we turned out. After the change in management he seemed with less trouble than formerly to do one-third more work and do it better. There were others who seemed to accomplish more. I raised 18's pay \$2 a week without saying a word to him. He responded in increased effort to a degree that has saved us from the expense of putting in a duplicate machine and paying the wages of an extra man. His pay has since been increased and he is now earning and receiving \$16 a week more than the union scale. Other employees caught on to the fact that we were willing to pay for good work and while their rewards have been smaller than the one I have mentioned, the result has been more than satisfactory. The saving on waste effort and spoiled metal, as a matter of fact, more than offsets the increases in wages."

The manufacturer went into some detail that it would be inadvisable to print, but so far as we have quoted him no harm can be done, while our readers will become informed of new reasons for the success of American manufacturers in putting forth durable

articles which may seem to be cheaper than they ought to be. Of course, our manufactured articles are never too low-priced for their worth, for they are always proved to be well worth what may be paid for them.

OIL SHIP'S BIG SAVING.

IN expanding our foreign trade the cost of transportation is an important element and anything that tends to lower the cost without impairing the efficiency of the service of the ocean steamships is of importance to the merchants and consumers of every portion of the habitable globe. Elsewhere in this issue we publish an account of the results of the 12,000 mile voyage of an American steamship which was made under steam generated by oil fuel. Careful tests were made on two voyages, one with coal and the other with oil and the outcome was a remarkable victory in favor of oil fuel. As a result of the test it was shown that the oil fuel saved the owners approximately \$8,000 on the voyage which was conducted with that substance used as a means of generating motive power.

We have heretofore mentioned experiments made in the use of oil fuel on steamships, but we have not heard of any tests conducted upon the scale and under the circumstances that governed the experiment upon the steamship Nebraska. The greatest care was taken to obtain accurate information and the work was done by disinterested officers of the company owning the ship, so that their conclusions may be accepted as a sufficient basis for looking forward to further and early developments in this direction by transportation lines.

It is doubtful, for a variety of reasons, if oil fuel will immediately enter to any great extent into the economy of management of fast passenger steamships, although the saving in cost of fuel of 50 per cent. would be an important and an attractive item, but as to that our readers are less interested than they are in the commercial questions involved. Aside from the probability of lower freight rates, an important saving in time was effected by the Nebraska—and quicker transportation is quite as desirable in our export trade as lower freight rates. Both are important items to the purchasers of American goods and anything that tends to bring our manufacturers and their foreign customers closer together, either in the way of cheaper freights or more speedy delivery of goods, is not only of advantage to both parties to each transaction but tends to benefit the trade of the world at large.

Coal has for so long a time been the standard fuel for ocean steamships that the change to oil will come slowly, despite the demonstrated economy of the new fuel. The change, however, is not quite a revolution, such as the installation of turbines in place of reciprocating engines would be, but it is nevertheless a step forward in the progress of the twentieth century that will gather impetus, when ship owners become aware of its value, much faster than has the turbine idea, for the cost of changing furnace equipment is much less than that of installing complete new engines.

LAST month the first passenger train ran across our new colonial possession, the island of Porto Rico, to the great amazement of the natives. The railroad, with its branches, is 156 miles long and it is equipped in real American style. Since the United States acquired the island, the application of American methods has made a new country of it. New life and energy have been given to the Porto Ricans and their trade with the rest of the world has been given an impetus that is gratifying alike to the inhabitants and to this country.

WHILE the discoveries made by the British Antarctic Expedition were of no commercial importance, Americans generally were much interested in the accounts of Captain Scott's voyage, for much valuable information regarding the icy region around the South Pole was contributed toward their enlightenment.

GERMANY'S plan to increase her consular corps is an evidence of progress. We learn that the number assigned to the United States will be considerably increased, the object being to foster closer relations between the two countries.

A CONTINUOUS PERFORMANCE.

Graphic Account of Transformation of Methods in America's Steel Industry.

WHEN Mr. Wilson, the inventor at the Carnegie Homestead Steel Works, U. S. A., asked Charles M. Schwab to back him in marketing a non-nicotine, "continuous" dry, cold-smoke smoking-pipe, Mr. Schwab laughed and jocularly remarked: "Invent a 'continuous mill,' Wilson; I'll back you on that." Wilson shook his head. The idea, however, stayed with Mr. Schwab.

In steel mills, the course of the material as it goes through the process of manufacture is normally zigzag. The ore, the molten metal, and the billets are carried by machinery or on cars here and there and back and forth for treatment. The "continuous mill" would be one in which the material would follow an approximately straight line from process to process—the acme of economical handling. It would comprehend a complete chain of mills under one roof, beginning with the furnace in which the crude steel is smelted from the ores and ending with the bins from which the finished product is loaded into cars for shipment—a mill operated entirely by machinery.

When Mr. Schwab became president of the Carnegie Company, he discussed the possibilities of his "continuous mill" with Mr. Carnegie. About this time the company planned to compete in Europe with European manufacturers in the sale of steel bars. Then the bar prices fell, and the company was about to abandon its foreign project as unprofitable, when Mr. Carnegie said: "No, let us build Schwab's continuous mill. If it operates successfully, it will lessen the cost of production almost half. We can then compete anywhere. Never mind the expense of several million dollars. We may be about to revolutionize steel manufacture."

That is how the continuous "merchant-bar" mill came to be erected at the Carnegie Steel Company's plant at Duquesne, Pa., U. S. A. For it was built. The mill is a marvel in every sense. Its main shed is more than a mile long. At the south end is located a furnace. Here is received the ore, dolomite, pig iron and other material, which is emptied into the furnace by huge electric charging-machines. One charging-machine is apportioned to from six to twelve furnace pits, operated by a single man. Each furnace is operated by a force of three, while half a dozen laborers complete the entire force of the department. In this furnace the steel is prepared for pouring in liquid form into large ingot molds which are transported, when full, into another department on trains of "buggies," or little flat cars.

These molds are placed in cooling pits. To make place for them, other molds, which have stood there some time, are now removed and transported to the first set of rollers, where the crude ingots are now subjected to their first rolling. These ingots weigh tons each, yet so perfect is the automatic arrangement that but one man is necessary to operate the levers which throw the steel, now considerably reduced in size, across other rollers, and still others, to the final "shaping" machinery.

In less than fifteen minutes after leaving the cooling pits the ingot has been compressed into what is technically known as "a shape." This shape now passes through its very last set of rolls and is cut into sections of exactly the same length, size and weight. Each of these sections is known as a bar. This bar is red hot. In this condition it is marked by steel stamps and thus identified for shipment.

The bars, as many as fifty being cut every minute, must now be cooled and loaded. They, therefore, pass up a ladder-like inclined plane to an elevation of about twenty-five feet. At this point the cooling bins are reached, into which they fall in great confusion. These bins resemble those of a great granary, except that they are built of steel and are perforated. Gallons of water are sprinkled over them continuously. The water and atmosphere quickly cool the newly made bars. The gates of the bins are now thrown open and the whole lot is dumped into steel cars that have been placed directly below. The process of manufacture is now complete.

That the process is economical is obvious, occupying hardly more than an hour after pouring of the steel from the pits of the furnace. Rush orders have often been received in the Carnegie Company's office at Pittsburg at 6 o'clock in the evening, and by 6 the next morning the proper number of bars have been manufactured, loaded and shipped to their destination.

There is a saving, too, in labor. Fewer men are employed in this continuous mill than in any single department of any other Carnegie mill. In transportation, also, there is saving. Whereas, at Homestead, for example, the hot ingots must be carried by means of steam locomotives, often a half mile through the yard, here they proceed to the rollers direct and reach their destination within a few minutes.

This mill is, indeed, a near approach to the solution of the grave problem of limited operating space that confronts steel manufacturers everywhere today. It is a triumph of industrial management.—*World's Work*.

British View of American Steel Methods.

IN the course of an excellent paper contributed to the West of Scotland Iron and Steel Institute, H. G. Waddie recently pointed out what he considered to be the real difference between the management of American steel mills and the British method. The central idea of American mill practice, he believed, was to get the largest possible output with the smallest pay-roll, and to attain this object all available labor-saving appliances were introduced, and continu-

ous working, with the aid, where possible, of continuous furnaces, had brought this system of working to a stage of comparative perfection. Wherever the movement of the material through the mill was independent of physical effort it was obvious that more work would be accomplished, as the continuous flow of material from one department to the other was only dependent on the furnace capacity. The successful introduction of labor-saving methods was dependent as much on the quality of labor employed as it was on the capital invested.

The prominence given to young men in the United States was a matter of surprise to many, he said, but he saw no reason for preference being shown to the older men, irrespective of ability, and he feared this was found the case in British practice. Why, he asked, should they stick to the apprenticeship system at home? Of what use was it to talk about bursaries and aids to pushing boys if they were to be forced to work for next to nothing during the period when they ought to be gaining a knowledge of their own value and acquiring that spirit of independence which is the feature of the American boy?

The subject of cheap production of iron and steel in the United States was not entirely due, in his opinion, to any great advance in plant or machinery, but rather to exceptionally cheap raw materials, transportation and the extensive scale on which operations were conducted.

Among other points mentioned by Mr. Waddie was the greater remuneration offered in the United States for good executive ability. Longer hours were worked, and the number of ordinary or unskilled laborers was not worth mentioning. Another feature of the American method was the distribution of the mills over a wider area of ground, while at home they were usually handicapped by the dimensions of the land at their disposal. The American mill was put down to make certain sections, and there was no endeavor to tackle every kind of steel order that might be offered. Again, wherever one went, most noticeable to the accustomed British ear in the mills, was the hum of the various motors at work all over the place, and why this power had taken so long to obtain a hold in the home works was a mystery.

New Profession—Doctoring Business Houses.

NEW ideas in business methods are constantly coming to the front in the United States. There is a new profession, reported to have in this country and at this time not more than half a dozen or so followers. It has dubbed itself "industrial engineering." The industrial engineer is an expert in business methods, labor-saving, and especial money-saving devices, all manner of commercial economies, and you are supposed to call him in as you do your doctor or your lawyer—even, perhaps, if you are able, keep one of him constantly at your elbow, as some people do their private particular doctors and lawyers. If you are a manufacturer, and you find your enterprise is not producing as many dollars as your wife can comfortably spend, you call in the industrial engineer. You explain to him all your methods, you show him your plant, your books, your bookkeepers all in a row on high stools. The industrial engineer, after more or less minute inspection, diagnoses the case. He shows you perhaps a waste in materials or how one set of books may serve where you are keeping two, demonstrates how the introduction of a particular set of machinery would in one year save enough to pay for it—and other things of that kind. Presumably, if you follow his suggestions your wife will presently be astonished at the readiness with which you give up the cash for her fallals, arts and charities. Again, if you are starting a new enterprise, you do not go it blind, but take expert industrial engineering advice as to the scale which is likely to be most profitable, as to each means of making every edge cut, as to a mass of details about which even though you are a good business man you may well be ignorant. Obviously, the industrial engineer may in both these cases be very useful and his fee may be large. Obviously, also, an industrial engineer must be a bona-fide expert, or something unexpected and sad will happen. The profession, exacting as it is, is already launched, and some have succeeded at it. There are offices of the kind in New York, Boston and other cities—offices full of file cases bearing on the systematizing and reorganization of commercial undertakings, as well as upon a mass of things which must be considered in order to understand diverse business. The industrial engineer, it is plain, is likely to have to consult with an infinite variety of other experts—accountants, mining engineers, electrical engineers, lawyers, sanitarians, architects, machinists, etc.

New Zealand to Have American Trolleys.

DESPITE the fact that the award was made to a New Zealand concern for the construction and equipment of the extensive electric traction system to be operated in and around Christchurch, practically all the material, equipment, etc., will be manufactured in the United States. The major portion of the subcontracts have already been awarded. The New Zealand Electric Construction Company, which was organized recently for the chief purpose of developing the water powers in New Zealand, will carry out the work of building the Christchurch lines. More than thirty miles of road will be constructed under the existing contract. The value of the contract is about \$1,250,000. The municipal authorities will operate the lines. The rails will be furnished by an American concern, and the cars, motors and trucks will be built in this country.

American Machinery for Great Britain.—A manufacturing company in Ohio has recently secured a large contract for machinery with which to equip British paper mills.

A WONDER OR A FAKE.

Professor Thinks He Has Discovered Force That Defies Law of Gravitation.

WONDERS, it is said, will never cease. Prof. E. L. Scharf, formerly of the faculty of the Catholic University of America, believes he has discovered the principle of negative gravity, whereby buildings can be lifted from the land and warships fearing submarine torpedo attacks may leave the water for safety in the air. Professor Scharf is a scientist, who has obtained some recognition, and a New York paper recently devoted a large amount of space to his alleged discovery. We may as well say that we do not indorse Professor Scharf in any way, but there is a bare possibility that his theories may have something in them, and we give our readers the information solely for the purpose of keeping them fully informed about the novelties of thought and scientific investigation that are going on in America. Professor Scharf says about his discovery: "I firmly believe that within fifty years the force called levitation will be so thoroughly understood and its uses and control so well demonstrated that it will occupy a position in the list of great public utilities, such as the electric telegraph, the telephone, the wireless telegraph and the electric railway hold to-day."

As a matter of fact, what he believes he has discovered ought to excite little more wonder now than electric lights, or telephones, or wireless telegraphy would have aroused half a century ago. Nobody knows the limits of man's genius or Nature's possibilities. A century ago, or half a century ago, this American professor would have been consigned to an asylum for lunatics, but in the present age of discovery his own account may be considered worth reading and further developments may be awaited. If there are any the readers of THE AMERICAN EXPORTER will be duly informed of the fact.

This is what he says:

"The earth being charged with positive electricity, proves that if a man could charge himself with the same sort of electricity he would be repelled from the earth's surface. 'Like repels like,' and opposites attract each other. It is a rule that is as old as the hills. You remember the elementary experiment with the two cork balls, suspended with silk cords. You rub one with resin, inducing a positive charge, the other with glass, charging it negatively. Then you approximate the balls and they fly together. Now you rub with glass the ball you had rubbed with resin, and on approximating them you find that they spring apart from each other. What does this prove? Both the axiomatic repulsion of similarly charged electrical bodies and the fact that it is possible to change the electrical nature of a given body.

"By charging my body with the same positive force that the earth contains I have actually reduced the weight of my body seven pounds, and only stopped the experiment there because I began to feel a fainting sensation about the heart that made me think perhaps there might be danger in the experiment. I had insulated a pair of the finest scales by placing them upon glass. Close to the scales I placed my electrical appliance, the construction of which I will, of course, not divulge, beyond saying that it employs wires which run from beneath the surface of the earth, connect with my body and back to earth again.

"Stepping on the platform of the delicately adjusted weighing machine, I noted with the greatest care the succeeding registration. I was growing lighter! One, two, three pounds was gone from my normal weight of a moment before. Prudence or timorousness dictated a halt, but the exhilaration of hope, the impelling desire to put my discovery to a positive test, bade me continue. The sensitive register showed a constant diminution of my weight. Four—five—six—yes, seven pounds lighter than when I first took the record. Accompanying this loss of weight were strange sensations, such as never in all my life had I experienced.

"A sense as of casting off physical moorings crept over me. Lightness gradually pervaded my body, and as I turned on the current I felt as if I was actually rising; yes, almost flying. It was a peculiar feeling about my heart which decided me to suspend the experiments, until I can test my plan on dummies and the lower animals, to make sure there is no attendant danger, or, if there is such danger, to obviate it.

"For years the idea of such a force opposed to gravity had buzzed in my brain. My attention was first called to it while I was connected with the Catholic University. The reading of the modern and classic Hindoo and Persian works made me take notice of the claim, seemingly substantiated, that seers of these two races were able by prostrating themselves upon the ground, and by other mystic rites which probably had nothing to do with the natural phenomena, to raise their bodies into the air. The fact that all the levitation claimed by the Eastern doctors was and is preceded by prostration upon the ground reveals the secret of the phenomena.

"I naturally inferred that something in the earth itself was the power which, properly controlled, was strong enough to successfully oppose the attraction of earth for physical objects. As a scientist, I knew that electricity was the underlying principle of many physical manifestations, and that the earth was charged with the positive element of electricity.

"As soon as I stepped from the scales, after my experiment of charging my body with positive force and reducing my weight seven pounds, the energy employed in the experiment departed to the earth, and a moment after, stepping upon the scales, I found that my weight was normal again. I firmly believe that within fifty years the force which for want of a better name has been called levitation will be so thoroughly understood and its uses and con-

trol so well demonstrated that it will then occupy a position in the list of great public utilities, such as the electric telegraph, the telephone, the wireless telegraph and the electric railway hold to-day."

It is not necessary to seriously discuss Professor Scharf's claims, but if there is anything in them a great field for speculation is opened.

Over Four Hundred Patents for Artificial Fuels.

REQUESTS from our foreign readers are received nearly every week about artificial fuel. From time to time we print what is current information on the subject in America. It is difficult to keep track of all the discoveries in this line. The following from an American Government publication is certain to interest them: "Everybody who has spent any time on the Continent of Europe has noticed the economy practiced by Europeans in the consumption of coal and marveled that the results should be so satisfactory. To be sure, the lofty, tombstone-like porcelain stove of the Germans has a chilly look at first, and the cooler atmosphere of German houses may give one a homesick longing for the furnace-heated rooms of America, but gradually the open-minded stranger comes to look with approval on the European arrangements for keeping warm, and to wonder why his own people have not perceived the beauty, the cleanliness, the economy and satisfactory results that some patent fuels have to recommend them. That many an American has turned the matter over in his busy brain is attested by a chapter on artificial fuels in Edward W. Parker's report on 'The Production of Coal in 1902,' which is about to be published by the United States Geological Survey as an extract from the annual volume of Mineral Resources.

"Prior to 1902 about 400 patents had been issued in the United States on artificial fuels, but up to the close of 1901 none had proved a commercial success. Mr. Parker gives a list of United States patents granted since January 1, 1902. It remains to be seen whether any of them will be successfully developed. The list includes thirty-seven patents, but contains no mention of fuels made from petroleum or petroleum residue unless used in connection with coal, lignite or peat. Neither does it include any compounds that have for their object the increase of fuel efficiency unless they are used in the manufacture of the fuel itself. Three patents were used on briquetting machinery. The steady advance in the price of coal—no less than 40 per cent.—which has taken place since 1898 has stimulated experiments looking to the invention of artificial fuels."

Germans Becoming More Interested in America.

UNITED STATES CONSUL HARRIS, at Mannheim, Germany, in a recent report made to the American Department of Commerce, gives some interesting information regarding the attention which the development of the United States has attracted in the Kaiser's domain. Says Consul Harris: "The recent marked increased interest among intelligent people of Germany in the institutions, industrial conditions and history of the United States is worthy of note. This increase has manifested itself in a variety of ways. There has been, for example, a considerable array of new and well-written German books on purely American topics. These books are found in all the leading book stores, and have been widely sold and commented upon. German newspapers and periodicals have published within the past year an unusually large number of letters describing travels in the United States, and leading articles on educational, industrial and other topics. Engineering, architecture, the legal status of woman, prison reform, college and university instruction, and a wide variety of subjects relating to the United States have received attention at the hands of newspaper and magazine writers in Germany.

"In at least two of the great German universities—Berlin and Heidelberg—during the present university year lectures are being given on the history of the United States. This has marked a departure in German university instruction and will greatly stimulate interest in the subject. This increase of interest in the United States is doubtless due to several causes, among which was the visit of Prince Henry of Prussia and the cordial feelings which the visit aroused on both sides of the water. While it would not be expected that all who write on American topics as seen from the German standpoint would fully agree, or that the conclusions reached would all be favorable, the general tone has been friendly and appreciative."

Automobile Progress in United States.

NEW YORK'S Automobile Club will hold a contest of "business" vehicles this month covering a practical test. THE AMERICAN EXPORTER chronicled last year's test as showing excellent results, but the promoters expect that the showing this year will be much better. This year the club will have vehicles employed for one week doing some merchant's regular routine of cartage work, accompanied by a technical observer who will note points of interest. The awards will be given according to the observer's notes. The Society of Automobile Engineers, recently formed in New York, will hold meetings regularly for the discussion of practical automobile building. In every American city the increased use of auto trucks and delivery wagons shows the practical use of the automobile. In New York Fire Chief Croker uses an automobile to go to fires. In one morning he visited six fires—two of them ten miles apart. This would not have been possible had he used a horse. Physicians, inspectors and trade solicitors find the automobile a great time-saver.

"1900" Washing Machine

AND ITS PARTS.

Interior view, showing clothes in process of washing.

Looking under Bottom of Washer.

Inside view of Tub and Bottom of Agitator.

Shows Washer with the tub removed from the frame and the agitator or disk which rests on the clothes and water during washing. It also shows the wringer in position as when in use.

"1900" Washer.

"Domestic" Washer.

"Home" Washer.

"1900 Junior" Washer.

"1900" Washer.

A Remarkable Record!!!

Reward of Merit!!!

Commencing in the year 1900 to manufacture the "1900" Washing Machine, we at that time "turned out" an average of Five Washers per day. During the month of August, 1903, we manufactured and sold OVER FOUR HUNDRED Washers per day.

A Remarkable Record!!!

Reward of Merit!!!

The "1900" Ball-Bearing Washing Machines are the embodiment of the results obtained from over twenty-one years' practical experience in the making of washing machines, and, unlike any other washer upon the market, **do not tear and wear the garment**, but by the adoption of our **agitator** tosses and tumbles the garment through a **whirlpool of water**, thus **forcing the water through the finest or coarsest fabrics**, causing the clothes to become **ABSOLUTELY CLEAN**, without boiling or scrubbing, without wear or tear, and without the use of chemicals.

"1900" Washer.

"Domestic" Washer.

"Home" Washer.

"1900 Junior" Washer.

"1900" Washer.

"1900" Ball-Bearing Washing Machines.

THE "1900" WASHING MACHINE.
Complete, Ready for Use.

"1900" Ball-Bearing Washing Machines.

Special Offer for Foreign Markets Only:

\$22.75

Upon receipt of Twenty-two Dollars and Seventy-five Cents in U. S. gold, or its equivalent, we will box, ready for steamer, and deliver F. O. B. cars at New York City, **One of Each (Four in All), "1900," "1900 Junior," "Domestic" and "Home" "1900" BALL-BEARING WASHING MACHINES.** Weight of the four machines, boxed, 340 pounds.

To facilitate our increasing export trade we desire to communicate with one responsible business house in each trade center of the world.

Tens of thousands of the "1900" Washing Machines have been sold in the United States, as well as in all parts of the world. Many of our agents at home are making over \$200 per month. Live men in your vicinity can do as well.

Orders received direct or through export houses; when ordering through the latter, to avoid errors, please mail us a duplicate of order. Our Illustrated Catalogue mailed postpaid.

The "1900" WASHER COMPANY

BINGHAMTON · NEW YORK · U.S.A.

Fuel Oil Fifty Per Cent. Cheaper for This Ship.

Oil as a fuel for locomotives and steamships has been a matter of investigation and experiment for some time and frequent reference has been made in THE AMERICAN EXPORTER regarding the progress made in this direction. Showing that the use of oil as a fuel on an ocean liner is a saving of more than one-half of the cost of coal, the comparative cost of the trips of the American steamship Nebraskan, after completing a 12,000 mile voyage, were made public last month by the American-Hawaiian Steamship company. Capt. W. D. Burnham, superintendent of the company, and V. F. Lasoe, engineer-in-chief, were highly elated over the result, and without doubt other ships of the fleet will be equipped for burning oil. The Nenadau, a sister ship, is thus fitted out, but the remainder of the large fleet are coal burners.

The long voyage of the Nebraskan from San Francisco to New York, the record trip of the world for vessels using oil as fuel, is attracting universal inquiry from maritime interests. Representing the Liquid Fuel Board of the United States Navy, Commander John R. Edwards, the president of the Board, and his confrères made a careful inspection of the Nebraskan.

One of the 1,400 horse-power boilers was shown with oil fires beneath it, the other not in action allowed for the examination of the burners and connections and an inspection of the action of the flames on the tubes and shell of the boiler.

On her first voyage the Nebraskan left New York August 7, 1902, and touching at the ports of St. Lucia, B. W. I., and Coronel, Chili, for coal, reached her destination in 57 days, 5 hours and 43 minutes. On that voyage 2,267 tons of coal were burned, costing \$10,050, and a crew of fifteen men was necessary in the fireroom. As on the trip just finished, the ship was at top speed under trial conditions.

With a greater cargo in her hold, the recent voyage, with oil as fuel, was completed in 52 days, 7 hours and 26 minutes, and 8,826 barrels, or 1,260 tons, of California fuel oil were consumed, costing \$5,500. There were nine men less in the fireroom, whose wages approximate \$50 a month each, and 457 tons of measured space for cargo was saved by reason of the lesser bulk of the oil. Five days were saved on the passage because no stops were made for coal and the trip's earnings were increased at the rate of \$500 a day, or \$2,500.

"Then there is the absence of cost of handling of ashes and the wear and tear of machinery necessary to do the work," said Capt. W. D. Burnham. "We expected that the fuel oil would make a good showing, but this result more than pleases us. I do not think that such a trial has ever before been made in the world. More than twenty-four thousand miles in the round trip, and on each of the two voyages, all on board, from the captain to those in the fireroom, doing their level best to make a record."

"Does the burning of oil affect the insurance?" was asked.

"No, our underwriters are satisfied because of the careful construction of the tanks. On each end of all of the tanks a coffer dam of steel is constructed to take off any leakage. So far there has been none. All the lighter portions of the oil have been removed and we are burning a residuum which has a high flash test."

International Steel Agreement Unlikely.

STEEL manufacturers from various countries were in consultation in London at the time this issue of THE AMERICAN EXPORTER went to press.

A despatch from London to the American Associated Press gave briefly this information as to the conference, which may be of interest to some of our readers: "Even the most sanguine do not expect immediate results from the exchange of views, now in progress here (in London) between representatives of steel manufacturers of the United States, Germany, Great Britain, Austria-Hungary and Belgium, with the object of establishing among the steelmakers of the important exporting countries an agreement whereby export prices will be fixed and indiscriminate 'dumping' be prevented. The movement, which was initiated by the Germans, will, it is thought by many interested persons, find an insuperable bar in the attitude of an influential body of Britishers who are equally interested as producers and consumers of steel in turning out the more highly finished class of goods and who profit from the dumping."

Officials of the United States Steel Corporation said that no representatives of that corporation attended any conference in London looking to a division of the neutral markets of the world. They admitted that the German trusts had made propositions of a tentative character looking to an agreement regarding prices in neutral markets, such as South Africa, China, Japan, South America and European nations, but that the advances had not resulted in establishing any definite conclusions. Several conferences abroad have been held, at which German, Dutch and English manufacturers have attempted to reach agreements, but the meetings did not bear any fruit.

At the present time the United States Steel Corporation is selling its goods in the world's markets at the best prices the trade will command. This is being done in an active competition with Germany, the chief competitor of the United States in the iron and steel business. Both countries are competing for business in England, where they are able to undersell the domestic manufacturers in raw steel, such as tin bars, billets and the heavy forms. In the manufactured forms, particularly in tin plate, England is easily able to hold its own.

This statement, which can be accepted as reflecting the official view of the United States Steel Corporation toward the division of the world's markets,

was made: "We have no part in any conference regarding the maintenance of price in neutral markets or other trade agreements. Our position is such that we believe that we can dictate terms, but no proposition has been submitted. We are simply awaiting developments abroad, believing that the time will come when trade arrangements covering the world's neutral markets can be made. In the meantime the Steel Corporation is selling goods as fast as it can and to the best advantage."

British Praise for American Railways.

NEVILLE PRIESTLY, Under Secretary to the Government of India, Railways Department, who was sent to the United States last summer to study American railways, has submitted his report. "The railways of America," says the report, "are commercial undertakings on a gigantic scale, and are operated under conditions which are to be found nowhere else in the world, since they receive no protection from the State and have had to fight their way to the front by sheer ability of management. If I have appeared enthusiastic at times it is because I was greatly impressed by the courage with which the railroad officers have faced their difficulties and the pluck with which they have overcome them. It is impossible to associate with the great men who have made their mark on American railways—I may say American national history—without being infected with some of the enthusiasm they show for their business, and no man can travel over their railways without becoming possessed of a great deal more knowledge than he previously had or without getting many valuable hints."

"Many of their methods are different from those one has been brought up to believe the only correct method, and it is not until one realizes that the one idea in the mind of American railway men is to 'get there,' and that they do 'get there' by the shortest and quickest way, and do not allow themselves to be turned aside either by red tape, old-time prejudices, tradition or any other of the bogies by which older countries are assailed, that one understands how the results have been obtained which one sees there. American railway men are quick to see a new idea; they are quicker still to try it; they take great pride in their profession, and are all striving to get at the science of it."

"That their methods are not always perfect is what might have been expected, but they have managed to do what no other country in the world has done, and that is, carry their goods traffic profitably at extraordinarily low rates, notwithstanding the fact that they pay more for their labor than any other country."

"It is in the study of how they do this that much benefit can be derived by other countries, and if I have in some degree succeeded in throwing light on their methods I shall feel that I have benefited others as well as myself by my visit to that great country where the courtesy of the people is only exceeded by their hospitality."

Largest Steam Engine for World's Fair.

LARGER than any other steam engine on the earth is the one that has just been shipped to the American World's Fair by the Allis-Chalmers Company. More than twenty railroad cars were required to transport it. It is a 5,000 horse-power machine. Two engines on the same pattern are in course of construction for the Manhattan Elevated Railway power plant. The machine is to be installed in the center nave of Machinery Hall, just east of the big gas engine which will hold a place directly opposite the main entrance. The foundations for the giant are already in place and the installation will begin at once.

The total gross weight of the shipment was 720 tons divided into 202 packages. The heaviest single package, made up of the shaft of the engine, together with the hub of the flywheel, was in ten pieces and its total weight is 116 tons. The engine, when erected, will occupy a floor space of 50 by 40 feet and will tower 39 feet above the floor level. The foundations extend 22 feet below the floor level. To install this engine a special crane will be used. This crane has a lifting power of 75 tons and will be able to lift the largest single casting of the giant.

Agricultural Machinery Opportunities in South Africa.—The *Welthandel* (*World's Commerce*) states that Mr. Henry Birchenough, who was sent to South Africa as commissioner by the British Board of Trade, calls attention to the favorable opportunity in the Orange and Transvaal colonies for the sale of agricultural implements and cheap farm utensils. The agricultural development of these colonies will be tremendous as soon as the projected railroads are completed, and, as the colonies have to start over again, there is now and will be a great demand for light plows, harrows, creamery utensils, etc. The Americans, says Mr. Birchenough, have recognized this already and are trying hard to secure as large a share as possible of this commerce.

More British Visitors Coming to America.—Fresh proof of the friendly attitude of British people toward America is to be found in the fact that in the autumn of this year the members of the British Iron and Steel Institute are to spend a month in this country making a round of the steel plants and shipbuilding yards.

Russia Likes Our Oil Filters.—The Burt Manufacturing Company, of Akron, O., recently received an order for thirty gross of its oil filters and another order through its agent in St. Petersburg for a large number of the same articles for the Russian Government.

Aspinwall Potato Machines

Make Large Profits Easy by Economizing in Time, Labor and Money.

We make a strong, practical and automatic machine for every stage of Potato Culture; in fact, the Aspinwall is the only complete potato implement line in the world.

With Our Machines seed is quickly cut to best advantage. Planting, fertilizing and covering are accomplished at any depth and width of row desired. Spraying is effectively done for bugs and blight. Digging and sorting are made pleasant and agreeable work by our time and labor saving machines.

Our catalogue, illustrating and describing the various styles of

ASPINWALL POTATO

Planters, Cutters, Sprayers, Diggers and Sorters made by us, mailed postpaid.

Aspinwall Mfg. Co., Jackson, Mich., U.S.A.

F. R. PATCH MFG. CO.,

RUTLAND, VERMONT, U. S. A.

BUILDERS OF

Stone-Working Machinery.

Specialists in the Construction of Planing, Sawing and Polishing Machines for Stone.

The world-famed marble mills at Rutland, Vt., owned by the Vermont Marble Co., are equipped with many of these machines which give the smoothest and best polished surface obtainable. This "Marble City" Polisher will polish any stone up to 3 feet in thickness. It has a swing of 7 feet 8 inches, so that by turning stone around, 15 feet or more square can be polished.

A patent wind-up apparatus either raises or lowers the polishing arm, as is desired, by merely pushing in or pulling out the lever shown near the handle in the cut. This rising and lowering apparatus consists of small gears on a level shown at the top of the machine, which itself rises and falls on the screw shafting, easily seen in the cut.

The total height of the polisher is 9 feet 6 inches and weighs, when boxed ready for shipment, 1,600 lbs.

We carry a large number of these in stock, - so that prompt delivery can be made.

The Burt Exhaust Head Realizes the Highest Expectations.

"The Burt Exhaust Head has fully come up to our expectations. These expectations were very high, and the work to be done in saving fuel, stopping waste and preventing a nuisance by reducing the noise of exhaust was more, really, than we expected the head to do, but it has accomplished it to our complete satisfaction. Thanking you for calling our attention to this valuable addition and help to our plant, we are,

"Yours very truly,
"SELMA (ALA.) WATER CO."

The water and oil that issue from the exhaust pipe disfigure, rot and rust the roof or walls of your plant. The Burt Exhaust Head allows nothing but absolutely dry steam to escape, thus it saves many dollars for repairs. The Burt Exhaust Head is the most reliable, the safest and most efficient head made.

The Burt Mfg. Co., 217 Main Street,
Akron, Ohio, U. S. A.
Largest Manufacturers of OIL FILTERS in the World.
Supplied also by Engine Builders, Dealers and Power Contractors.

BECKER-BRAINARD

Automatic Gear-Cutting Machines

CUT SPUR, BEVEL AND WORM GEARS.

Each size will cut a range of gears requiring two ordinary machines.

All working parts being simple and in plain sight, are easily adjusted.

If you wish to cut accurate gears at the least cost, write for further information.

BECKER-BRAINARD MILLING MACHINE CO., Hyde Park, Mass., U. S. A.

OUR AMERICAN WORKMEN.

Facts About the Men Who Make the Best Machinery Produced Anywhere.

ONE of the secrets of the success of American manufacturers is in having skillful workmen. The question of the merits of unionism or non-unionism is one that does not enter what we have to say at this time, but, regardless of what anybody may think, it is, nevertheless, true that the union machinists of America are wonderfully good workmen, and that their organization is a remarkable one. Frank G. Carpenter has recently contributed an interesting article to the *Washington Star* upon the subject, and some brief extracts from it will give our foreign readers an idea of the sort of stuff American workmen are made of. Mr. Carpenter says:

"I met President O'Connell at the headquarters of the International Association of Machinists in Washington. They take up the greater part of a floor of a large building, and their business is managed as carefully as that of a bank or a great mercantile establishment. Two typewriters were clicking away in Mr. O'Connell's office as I entered, and they kept on clicking while we talked. I first asked as to just what the International Association of Machinists was. Mr. O'Connell replied:

"The International Association of Machinists has more than 70,000 members, and it embraces about half of all the men in the trade. It has local unions scattered all over the United States, Canada and Mexico, the largest being in the chief manufacturing centers. In Chicago there are about eighteen different unions, each of which sends its delegates to a district union, which acts for that city. We have a large number of local unions in New York, Boston and Pittsburgh, and more or less in every manufacturing city of the South and West.

"The word machinist as applied to our trade,' said President O'Connell, 'represents the highest intelligence and the greatest skill among the men who deal with machinery. In our sense, the machinist is the man who makes, erects and repairs all descriptions of machines and machine tools. It is not the man who runs the machine to produce another product after they are made. Our men design and make machines with the aid of drawings. They operate machines to make machines and machine tools, and they have to be able to do all kinds of work and repairs on any kind of machines from patterns, and that within a reasonable time.

"Their work includes the making of the finest and most delicate machinery, such as the tools with which watch movements are made, and it includes the making of the heaviest and coarsest of machinery, even to the great lathes which bore out the guns for our men-of-war. The machines for making bicycles, automobiles, typewriters, sewing-machines, and, in fact, every kind of machine and machine tool, is the work of the machinist. Such work requires great intelligence and skill. The man must be an inventor as well as a mechanic. He has new problems coming up with every job, and he has to use his judgment in almost every bit of repairs which comes before him."

President O'Connell denied that his association tried to restrict the output, and was asked if the rule about one man to each machine did not operate in that way.

"Not in work like we do," replied Mr. O'Connell. "Our machines are necessarily fine, and we have to insist upon that rule to protect ourselves. The employer will say he is willing to stand the loss of any work spoiled by having a man run several machines, but we find that if the work is spoiled the man is discharged sooner or later. In some of our work a man does not need to touch his machine for a long time, as, for instance, in boring out the barrels of great guns. A machine may be set and take twelve hours before the boring is completed. We insist upon having a man watch that machine, for the least break or fault may ruin the whole work, whereas, if the man is there he can remedy the defect the moment it comes."

"Our machines," Mr. O'Connell went on, "are so fine that they need constant watching, and the mistake of a hair's breadth may cost thousands of dollars. The bricklayer knocks off too much from the corner of a brick with his trowel in laying a wall; he throws in an extra pint of mortar and the fault is repaired. In the machinist's work the mistake of one ten-thousandth of an inch may destroy a machine, and much of our work has to be correct even to the hundred-thousandth of an inch."

So that the union system, as applied by Mr. O'Connell's union, is responsible for better work than might be otherwise produced. Accuracy and attention to details in producing American machinery are of great importance to the purchasers, and this brief insight into American methods will show our readers that when they are buying our machinery they are getting the best that can be manufactured. All of the advertisers in *THE AMERICAN EXPORTER* manufacture their goods with the same degree of care that President O'Connell insists upon. Of course, he does it for the protection of his members, but the manufacturers, the exporters and the customers in foreign countries are equal beneficiaries.

American Car Couplers in Bavaria.—The Bavarian railways have been for some time making experiments with American couplers. In the summer of 1903 trials were given in Nuremberg, and experiments were made anew on special trains early this year. The report is most favorable. The main point was what change could be made from the present screw coupling to the self-acting coupler.—*James H. Worman, United States Consul-General, Munich, Germany.*

Two Miles a Minute—Oddities of Speed.

WHEN one of the fast American auto boats is dashing through the water at the rate of from 20 to 25 miles an hour the propeller wheel revolves from 500 to 1,250 times in a minute. When the number of revolutions is stated one rarely comprehends what it means. In a boat of high power the propeller will be 23 inches in diameter. This means that its periphery is a little over 6 feet. If this screw revolves at the rate of 1,250 times a minute the outer edge of the blades of the propeller are cutting through the water at the rate of just one and a third miles a minute.

These propellers are not flat. If they were they would have no purchase on the water and the boat would not move an inch. To give them a grip on the water each blade is twisted slightly, like a spiral, and this twist increases the stretch of the blade beyond its circumference by about 1.4, so that what marine engineers call the helicoid path of the propeller would be very nearly two miles a minute. This remarkable speed is produced by a motor that is only 28 inches wide, 40 inches long and 41 inches high. It develops a horsepower of about 65.

The propellers which drive the fast Atlantic liners are about 48 feet in circumference. The tip of the blade will cover about a mile and a fifth each minute when revolving at full speed.

The United States cruiser *Minneapolis*, which is one of the fastest in the American navy, has propellers 48 feet in circumference. They make 132 revolutions a minute, so that the tip of the blade when driven at full speed is traveling at the rate of 6,336 feet each minute, and the helicoid path, or the distance covered by the spiral twist of the blade, is 8,870 feet a minute, or more than a mile and a half.

The *Minneapolis* and the ocean liners are driven by steam, but in the fast auto boats gasoline is the motive power. It can be understood to what a nicety the mechanism in a gasoline engine is adjusted when it is stated that to make 1,000 revolutions a minute means that in a four-cycle engine there are 500 sprays of gasoline forced into the cylinder. Five hundred times the electric battery makes a spark and 500 times the escape valve is opened to let the gas out.

If there are four cylinders at work on the same shaft, and many of the fast boats have four cylinders, then each operation is repeated four times. Some motors have eight cylinders, and one is now being built that will have twelve cylinders. It is figured that a motor uses a pint of gasoline for each horse-power an hour. An eight-horse-power motor will use a gallon of gasoline an hour and will cost about 16 or 17 cents an hour to run. A 24-horse-power motor will take three gallons an hour, which will make the cost about 50 cents an hour.

There is a motor boat now being built in America that is to have a 500-horse-power motor. This motor will consume about sixty gallons of gasoline an hour, and if run for ten hours a day will cost more than \$90 a day.

What Our Mechanical Progress Means.

MODERN progress is shown so forcefully in a recent article in the *Engineering Magazine* that this extract is worth using: "How futile it would be to attempt to do by manual labor the work performed by the steam engine! An ocean steamer of the *Lucania* class is propelled by a force of 30,000 horse-power. Counting six men to the horse-power and three shifts every twenty-four hours, the mere driving of the ship would call for 540,000 men, and if such a vessel could carry 10,000 men and their provisions it would be only one-fifty-fourth of the size necessary to carry its own motive power. Without steam our present ocean service could not be, nor could one of our passenger trains carry a sufficient number of human laborers to propel itself at present speeds and continued service, to say nothing of the freight."

The heat engine, steam, and its offspring—gas—are doing three-fourths of the world's work, and where the heat engine is the most used there is where the world is best civilized and where idleness, suffering and poverty are the least common, asserts the writer, who evidently classes hot-air engines with gas, as do many persons who class air-power with gas-power. The manufacturers of the United States make the best steam engines, the best gas engines and the best hot-air engines to be found anywhere in the world.

Our Trade with South Africa.—So far as South Africa is concerned, Mr. Chamberlain's scheme of a vast trade association of Great Britain and her colonies, as against all other countries, does not show much promise of success. The steamships sailing from New York last month carried even larger cargoes than usual. One vessel alone carried \$394,056 worth of our exports destined for East London and Delagoa Bay. In the list was very nearly everything produced in the United States, including canned foods, oils, machinery, provisions, tobacco, boots and shoes, notions and even milk. The list would fill a whole page of *THE AMERICAN EXPORTER*.

Our Trade with Spain.—Complete figures for 1903 show that with relation to American trade both the exportation from Malaga to and the importation from the United States have considerably increased. This is especially true of the imported American goods, a greater quantity and value of the latter having entered this port. The imports of American goods into Malaga show a steady increase in most of the leading articles.—*D. R. Birch, United States Consul, Malaga, Spain.*

Griffin Cleaner and Paste Combination

for Cleaning and Polishing Russet and Russia Leather Shoes and all Articles made of Russet and Russia Leather.

NOTE—Our Cleaner contains no Camphor.

Our Cleaner and Paste Combination for cleaning and polishing Russet and Russia Leather Shoes (and all articles made of Russet and Russia Leather) cannot be surpassed, if used according to directions.

The Cleaner cleans and removes stains, and the paste produces a brilliant, durable waterproof polish, which is not sticky or gummy. We also make it in different colors, ox blood and brown.

Price per gross, large size.....\$14.00
Price per gross, small size..... 7.50
Discount, 10 per cent.

Griffin Russet Leather Polishing Paste.

Our Russet Leather Paste for producing a high gloss on Russet and Brown Leather Shoes (and all articles made of Russet or Brown Leather) cannot be surpassed, if used according to directions. It polishes quickly and easily; its lustre is brilliant, durable and waterproof, and yet is not a varnish.

Excellent for vici kid.

We guarantee it not to injure the leather in the slightest degree, as it is free from acids, and will not soil the finest of fabrics.

If the shoe is dirty is should first be cleaned with Griffin Russet Leather Cleaner.

Price per gross, large size.....\$6.00
Price per gross, small size..... 3.50
Discount, 10 per cent.

Our Parisian Dressing.

A Black Dressing for Ladies' Shoes. Is considered by good judges to be the best and nicest put-up 10-cent dressing on the market.

We guarantee it not to contain anything injurious to the leather. It contains oil which helps to keep the leather soft and pliable. Packed in one and three dozen boxes.

Price, per gross, \$8.00.
Discount, 10 per cent.

Griffin Sterling Combination

Our Sterling Combination for dressing and producing a gloss on shoes made of Box-Calf, Cordovan, Vici Kid, French Enamel and all fine dry black leathers. Cannot be surpassed if used according to directions. It is easily applied, polishes quickly and easily; its lustre is brilliant, durable and not sticky or gummy and will not crack or scale off. It keeps the finest of leather soft. We guarantee it not to injure the leather in the slightest degree, as it contains no acid or other injurious substances.

A circular in each package giving full directions.

Price per gross, large size.....\$15.00
Price per gross, small size..... 8.00
Discount, 10 per cent.

Griffin Patent Leather Polishing Paste.

Our Patent Leather Paste for restoring the gloss to all articles made of Patent and Enamel Kid Leather cannot be surpassed. It polishes quickly and easily; its lustre is brilliant, durable and waterproof, and is not a varnish, as it leaves no coating.

We guarantee it not to injure the leather, as it is free from acids.

It is invaluable for brightening the saddle and blinders of harness, as the polish is waterproof.

Just the thing for manufacturers of harness to use, as it will prevent the Patent Leather parts from becoming dull.

Price per gross, large size.....\$6.00
Price per gross, small size..... 3.50
Discount, 10 per cent.

Griffin Russet Traveler's Outfit.

An excellent thing to take along when traveling. Contains a bottle of cleaner for cleaning and removing stains. A box of our polishing paste and a polishing mitten.

Price per gross.....\$18.00
Discount, 10 per cent.

GRIFFIN SNOW WHITE.

For cleaning and re-whitening white shoes made of canvas, suede and buckskin.

Price, per gross, \$10.00.
Discount, 10 per cent.

NONE BETTER MADE AT ANY PRICE.

Send us a trial order through any commission house in New York; above prices f. o. b. N. Y.

GRIFFIN

High-Grade Shoe Polishes.

GRIFFIN M'F'G CO.,

82 Cortlandt St.,

New York, U. S. A.

Griffin Sterling Traveler's Outfit.

For Box-Calf, Vici Kid, French Enamel and all dry Black Leathers.

Put up in a carton. Contains a bottle of Sterling Dressing, a box of Polishing Paste and polishing mitten. Also suitable for Enamel and Patent Leather.

Price per gross.....\$18.00
Discount, 10 per cent.

OUR NEW BIG BATTLESHIPS.

Novel Race Between Government and Private Concern in Building Two of Them.

NEVER before has there been such a contest of brain, brawn and machinery, even in combats at sea between warships, than is now going on in the United States in the work of building two great battleships for the American navy. These ships are exactly the same type, and each is to cost, approximately, \$4,000,000, the monsters to be completed within forty-five months. One ship, the Connecticut, is being built at the New York Navy Yard, under Government construction, while the sister ship, the Louisiana, is being built by a big private corporation. The test is really being made to find out whether the Government can build its ships better and quicker than private parties can do the work, or *vice versa*.

Naval Constructor Baxter, who has charge of building the Connecticut, recently talked about the contest. He deprecated the idea of rivalry, smiling as he did so, and then explained: "There is, properly speaking, no contest with the builders of the Louisiana; it is a race against time. We are, each of us, building what is designed to be a great battleship, and my task is to complete the Connecticut within the limit of both time and money set for the Newport News Company in building the Louisiana. It is merely a test of the navy yard—not one of other people.

"As to whether we shall win there is a grave question. We are making an uphill fight. The Government yards are at a disadvantage in competing with private concerns for several reasons. For one thing the private yards get ten hours' labor in a day for the same price that the Government pays for eight hours' work. There is, you see, a difference of something like 25 per cent. in favor of the private yards, in so far as labor is concerned. In addition, one must take into consideration the twenty holidays within a year when no work is done in Government yards, but for which, nevertheless, the men are fully paid. So much for labor.

"Regarding material, it is well known that the method of Government purchases is cumbersome. A private concern can buy at less cost almost all the material that goes toward the equipment of a battleship. So you must realize that we have a hard race to make. In the matter of time we are also at a disadvantage. When the fleet is at sea we can devote all our time to the Connecticut, but when the ships come in, demanding repairs, we are compelled to give them the preference, and then all work upon the big battleships is practically at a standstill."

The race at present, a trifle over a year from the start, shows the private concern leads with 40 per cent. finished on general construction, while the Navy Department has accomplished only 31 per cent. On the engines, however, the navy men reverse the figures, for they have 31 per cent. finished, while the private firm has accomplished only 20 per cent.

The naval constructor said: "It is accepted at present by naval experts that the battleships of a navy form its backbone, as it were. It was with this idea in mind that the planners of the Connecticut and Louisiana worked in forming their designs. Their idea was to combine armament with speed—to couple the speed of a cruiser with the strength of a battleship of the earlier type. The English navy has several ships of 16,000 tons' displacement, which is to be that of the Louisiana and Connecticut, but their batteries do not equal those which will be placed on our vessels. One feature of importance in our batteries is the submerged torpedo tube.

The Connecticut and Louisiana will each be equipped with four of these. In the old type of battleship the torpedo tubes were above the water line, but it was found that this construction rendered them more dangerous to the ships on which they were placed than to those of the enemy. In the event of a shot crashing through the comparatively vulnerable superstructure and striking a torpedo the ship undoubtedly would be blown to atoms. The present arrangement, however, makes such a disaster all but impossible, for a shot that strikes a ship below the water line does little or no damage. The submerged tube discharges the torpedo into the water from below the line, and all the apparatus and explosive matter in connection with the tube is stored in the depths of the ship.

"Some idea of the immensity of a battleship may be formed from the fact that we already have placed 7,500,000 pounds of metal in her, although the mere shell is barely completed. The total displacement of 16,000 tons includes the weight of the ship when everything is in place—the guns, armor, engines, coal and incidental furnishings. It is difficult to give an adequate idea of the tremendous power for destruction of such a vessel when hurled forward by the momentum of her engines upon an adversary.

"The two ships are each to be 450 feet long on the load water line, with an extreme breadth of 76 feet 10 inches. Each is to have twin-screw vertical expansion engines, and yet one may be faster than the other by several knots and immeasurably superior in a heavy sea. The utmost skill of the best mechanic cannot produce perfectly identical results. So far as we have gone, the most efficient fighting machine is the battleship of the type represented by the Connecticut and the Louisiana.

"On this steel shell, which represents the ship proper, the armor will be buckled from the water line. It will vary in thickness. Over the more vital parts it will measure 11 inches. In other portions it will be 9 and in still others 4 inches thick. The barbettes will be incased in armor 10 inches thick for the heavier guns and 6 to 4 inches for the smaller ones. There will be two military masts and three funnels. We are supposed to give her a speed of better than 18 knots, and the indicated horse-power is 16,500.

"The battery of the Connecticut is to be one of the heaviest in existence. In the bow and stern turrets the four 12-inch guns will be placed—two in each. To the port and starboard of these will be the turrets for the 8-inch guns—four turrets in all, and two guns in each. Disposed at points between the 8-inch turrets will be the twelve guns of 7-inch bore—something new in the armament of our ships. The secondary battery will include twenty rapid-fire guns of 3-inch bore, twelve semi-automatic 3-pounders and eight automatic 1-pounders. With the four submarine tubes the Connecticut will be able to give any ship afloat a very unpleasant quarter of hour."

The mean draught of the ships will be 24 feet 6 inches and the coal supply 900 tons. Twenty-six feet 9 inches is to be the maximum draught, and if a shot should pierce the hull beneath the water line, a layer of cornpith, placed between the outer and inner shells, will swell and effectually stop the leak. Each ship's complement will include 42 officers and 761 men.

American Progress in Labor-Saving Machines.

ROBERT W. HUNT contributed to the *Engineering Magazine* recently a wonderfully interesting and comprehensive article about "The World's Great Labor-Savers and Labor-Servers," in which he described in detail what has been done, particularly in America, in the direction covered by the caption of his article, which fills more than thirty pages of the magazine. The following extracts are worth reading, as is indeed the entire article:

"It certainly is an inherent quality of the human mind to seek the lightening of whatever manual labor the environment of habitation may require. This has been manifested in all known ages, and the discovered relics of prehistoric man point to the same fact. And it is notable that either the development of these labor-saving devices has brought about an equal elevation of human condition, or else such bettered conditions have demanded, and hence commanded, the devices. At all events they have practically gone together.

"It needs no argument to prove that the physical, moral and mental condition of the tiller of the soil in all civilized countries is far in advance of that of the same class in past generations, and in no occupation has there been greater development of labor-saving machinery. The man preparing the soil for the receipt of grain by the use of a sulky plow has to be a higher organism than he who scratched the ground's surface with a bent stick, or even a grubbing hoe. And the rate of development of the man has been equal with that of the tools used by him. So it has been in all the occupations of life."

To write of them all, says Mr. Hunt, would fill an encyclopedia, and he confines himself to the development of labor-saving machinery in the making of iron and steel. In that industry it has been remarkable both in rapidity and results. Says Mr. Hunt: "In fact, iron and steel may be considered as the foundation stones upon which the edifice of civilization rests. Their development and growth have made all else possible."

In conclusion the writer says: "Comparison of the general condition of the inhabitants of the United States at the beginning of the period covered by my narrative, during that period and now, will demonstrate that there has been a progressive improvement, and that the standard of living has been raised. If the spirit of unrest has also increased it is because the people have learned to want more, because it has become possible to have more."

It may be added that such of our readers as are interested in a historical narrative of the matters here referred to will find it well worth the trouble to procure a copy of the *Engineering Magazine* containing this article.

Operating Gas Engines with Wood Gas.

VARIOUS attempts have been made to produce power in many forms, some of which have been successful, but none more interesting than the application of wood gas to gas engines. The last issue of *Power* gives some account of an extensive plant of this sort, from which we make these extracts. The gas for eight engines is supplied from two sets of producers, each set consisting of two producers and one boiler. At first these producers were fed with bituminous coal and the producer and water gases, generated intermittently, were delivered in the first case to a 15,000-cubic-foot holder and in the second to a 5,000-cubic-foot holder. It was not until some time after the plant had been running that the trials of making gas from wood fuel were made. The results of these trials were that they are now using wood exclusively, and instead of making producer and water gas separately they are injecting steam with the air in the producer and producing a mixed gas whose quality does not vary much, as the condition of the fires can be kept nearly constant. The gas produced has about the same calorific power as that produced by the use of coal, and with proper management is surprisingly free from tar and partially condensable distillates which are injurious to the engines.

The operation of the engines on wood gas has been most satisfactory; the parallel operation of the generators with good results and the infrequency of shutdowns and repairs have been a noticeable feature. A test showed a consumption of only 2.97 pounds of wood per brake horse-power per hour.

This plant is the first of large size which has come to our notice in which wood has been used as fuel for producing power gas for gas engines. The success which attends its use in this plant and the economy of fuel obtained in the regular operation of the engines open up great possibilities for the economic generation of power in plants in which the conditions are the same as in this one, and indeed in any plant.

Cary's Universal Box Strapping.

Made of Soft Steel through which nails can be easily driven.

Put up in coils of 300 feet each and packed 20 coils in a case.

Made in four widths, viz.:

$\frac{1}{2}$, $\frac{5}{8}$, $\frac{3}{4}$ and 1 inch.

Patented in all countries.

Packed very securely for export.

THE BRILLIANT ELECTRIC COMPANY, Cleveland, Ohio, U.S.A.

MICHAEL'S LAWN SPECIALTIES

Have been on the market over 46 years,
and have successfully stood the test of time.

Our Motto Is: **QUALITY** in Every Instance.

Michael's Lawn Settees and Folding Chairs.

Our Lawn Settees and Folding Chairs are the most practical ever placed upon the market. The curve in back is exactly right. Painted red or green, or natural hardwood finish. Six 5-foot Settees, crated, containing about 25 cubic feet; weight, 96 lbs.

Price, per dozen.....\$18.00

Six Folding Chairs, crated, containing about 14 cubic feet; weight, 30 lbs.

Price, per dozen.....\$6.00

Michael's Folding Rocker.

Is the neatest and best article ever placed before the people. Folds as shown in cut. Painted red or green, or natural wood finish.

Six Folding Rockers, crated, containing about 14 cubic feet; weight, 48 lbs.

Price, per dozen.....\$9.00

New Michael Lawn Swing.

For grace, solidity and beauty the New Michael Four-Passenger Adult Lawn Swing has no equal. All parts are bolted or screwed. We use no nails except in chair slats. No tools required in setting up. We guarantee the New Michael Four-Passenger Adult Lawn Swing to be the best made. Opens and closes like a jack-knife. Contains about 20 cubic feet each, and weighs, each, 150 lbs.

Price, per half dozen.....\$30.50

NOTE.—The prices above quoted are f. o. b. New York City.

We also make the Michael Porch and Lawn Reclining Chair.

LA PORTE,

INDIANA, U. S. A.

AMERICAN SUBMARINES.

Progress Made in America in Constructing Safe and Efficient Vessels of This Type.

THE advances made in submarine navigation will unquestionably have a potent effect upon the peace and prosperity of the world. The subject is a fascinating one for everybody, and the important part the submarine is to play in the stability of international trade makes some account of the exploits and possibilities of the newest United States submarine torpedo-boat worth reprinting from the New York *American*. The boat is named the Protector, and her tests have been made at the Government station at Newport, on the Atlantic Ocean coast. With three men on board she sank in thirty feet of water and began to travel up and down, backward and forward, on wheels along the bottom of the sea in search of the cable which the Protector had been commissioned to find and cut. Within a very few minutes the cable was found and hauled up into a compressed air compartment, the door of which stood wide open, although the boat was completely submerged. Inside the compressed air compartment stood the members of the crew. Instead of cutting or tapping the cable, as they would have done in time of war, they tied a piece of rubber hose and an incandescent lamp globe to the cable as proof of the success of their errand. The cable was restored to its resting place along the seabed, and the crew prepared dinner and served it, and then brought their boat to the surface near the shore, after being down for four hours.

In a previous test two members of the crew, one in a diving suit and the other wearing a bathing suit, stepped out of the Protector's side door, 45 feet below the surface. The diver walked leisurely away from the strange craft, sat down on a piece of wreckage and began a telephone conversation with the Protector's captain. Inside his diving helmet was a telephonic transmitter and repeater, connected by wire with one of the regulation telephones to be seen in every American business office inside the compressed air compartment of the submarine boat.

The other man in the bathing suit rose to the surface like a cork and struck out for shore, to show that in case the boat was totally disabled under water it would still be possible for the crew to escape by way of the door in the compressed air compartment.

The Protector, in view of her remarkable characteristics and performances under water, has been pronounced the most deadly and dangerous and at the same time the most useful war craft ever constructed. She can travel along for miles and miles 150 feet under water, seeing and yet not being seen, cutting and tapping cables, planting or removing submarine torpedoes and mines, locating the enemy's ships and successfully launching torpedoes against them without giving the enemy the faintest clew to her whereabouts.

For war service the Protector will carry a crew of six men. Her two 125-horse-power gasoline engines supplemented by electric motor power send her through the water at a tremendous clip in search of the advancing ships of the enemy. The conning tower is the best place to be in for making observations while cruising along on the surface in this way. But when the enemy's ships are supposed to be not more than twenty miles away the captain of the Protector prepares to make his strange little craft as inconspicuous as possible. This he does by opening valves and allowing the water to flow into the hull through two grated holes on the side. This causes the boat to settle down lower and lower in the water, until finally nothing remains visible above the surface but the conning tower.

Still the captain is not satisfied. The conning tower might be observed by a lookout armed with a powerful telescope on one of the ships of the enemy. He lets water into the main central ballast tanks and the other ballast tanks, if necessary, till the conning tower has dipped down and nothing remains above the water but the sighting hood.

This sighting hood contains an omniscope, something like the old-fashioned camera-obscura, equipped with lenses and a mirror-like arrangement, whereby the entire surface of the sea for miles and miles on all sides around is reflected in miniature on a table or ground glass in the conning tower. By watching the reflected picture on the table he can instantly detect any ships that may come within range of the omniscope. It is not necessary to raise the Protector above the surface of the water to see the ships and locate them. The omniscope will do all of that.

The *American's* story describes an imaginary battle in which the Protector does great service, but as to that we have not the space to reprint it. The most interesting feature, in view of the disaster to the British submarine A1, is given below:

"The forward or diving compartment is, of course, the most interesting and spectacular feature of the boat, because it presents the amazing possibility of leaving a submerged craft by opening a door in the side, and without any danger of the water rushing in and filling the boat. This compartment is separated from the crew space by an air and water tight bulkhead and by an air-lock 42 inches long, built into this bulkhead and fitted with air and water tight doors, the whole being designed to withstand a pressure of 75 pounds to the square inch. The diving compartment is fitted with a connection to the low-pressure air system, a telephone and a gauge with two hands, one of which registers the pressure due to depth of water and the other the air pressure within the compartment.

"In the bottom of the compartment, forming a portion of the hull, is a cast iron door, hinged at its after end and stiffened with transverse ribs,

which, when the door is open, serve as steps. The door is raised by small hand-winches with wire rope falls and secured with dogs.

"To open the diving door, when resting or running along the bottom of the sea, the air-lock doors being closed, a valve on the air connection is opened and the pressure in the compartment allowed to increase gradually until the two hands on the gauges balance. A try-cock in the door is opened and the balance of the pressure is verified. The door is then undogged and allowed to swing open, giving, in clear water, a view of the bottom.

"The man who is to step out of the submerged boat has already put on his diving suit, fitted with telephone connection. The air-hose is connected with a low-pressure air-tank in the compartment, the pressure being controlled by the diver through a valve in his helmet. In this way he will be well supplied with air and will be in constant communication by telephone with the other members of the crew on board.

"The wheels on which the boat runs along the bottom are of cast iron 34 inches in diameter and with 10-inch steel rims. They are hung from steel jaws and are 'housed' when not in use in pockets in the boat's hull."

Automobile Torpedoes in Modern Warfare.

BUSINESS men throughout the world do not devote much time to reading or thinking about torpedoes in warfare, so that an article on the subject by Hudson Maxim, the American inventor, published recently in the *Woman's Home Companion*, may afford some information that is worth knowing in reading accounts of the war between Japan and Russia. Mr. Maxim says: "The modern Whitehead torpedo, generally known as the automobile torpedo, because it is self-propelling, may perhaps just be considered the most wonderful of all modern weapons. This torpedo consists of a strong steel cylinder somewhat in the form of a cigar, being about 18 inches in diameter and about 18 feet in length. It carries in its front end a charge of about 200 pounds of high explosive, provided with a percussion fuse, by which it is exploded when it strikes the side of a warship. The main body of the cylinder is filled with compressed air, forced in by powerful air-pumps, until a pressure of 1,500 pounds to the square inch is attained. Immediately rearward of the air-chamber is the driving mechanism, which is run by the compressed air which in turn drives the propellers for forcing the torpedo through the water. A rudder is provided for keeping the torpedo on a straight course. A gyroscope is employed for operating the steering mechanism, and this device is one of the most ingenious known to modern science. The least deviation from the straight course is instantly corrected, and the torpedo travels through the water as straight as an arrow. The compressed air, of course, is soon exhausted, but it will last for about one minute, and drive the torpedo in that time a distance of about half a mile. In other words, the speed of the torpedo is about half a mile a minute."

Mr. Maxim has invented a new system of propelling automobile torpedoes by which a material called motorite, somewhat resembling smokeless gun powder, is employed instead of compressed air for furnishing the motive power. The motorite is used as a fuel, by which water is evaporated and steam made, which drives the engine of the torpedo. Motorite provides more than double the power that the compressed air is capable of giving for an equivalent length of time, and it is expected that this torpedo will have a speed even greater than the swiftest cruiser or torpedo-boat destroyer.

Blazing the Way for Our Thrashing Machines.

UNITED STATES CONSUL G. BIE RAVNDAL, at Beirut, Syria, tells of the invasion of that country by American agricultural machinery. "The machinery," he says, "was a modern steam thrashing rig, the second of its kind that ever came to these shores. Its recent 'triumphal march' through Damascus stirred the White City of the East from center to circumference. On its way into the country it broke down bridges innumerable, but pulled itself and train out of the creek beds beautifully, and it has the honor of being started on its pioneer career in the presence of the Governor-General of the Province, the field marshal in command of the Fifth Army Corps and many other gentlemen of high station in Ottoman civil and military life.

"With its self-feeder, automatic bagger, straw-bruiser, etc., it is a marvel of ingenuity, and its service to this country, in blazing the way for labor-saving machinery, with its accompanying amelioration of industrial and social conditions, in a region east of Mount Hermon, where people live and work as did their forefathers when Abraham crossed their pastures with his Chaldean flocks, is beyond estimation."

Our Trade with Southwest England.—United States Consul Stephen Plymouth, England, reports that American apples have a large and regular sale in quantities of 200 barrels and upward. The supply shipped into his district does not equal the demand. American vehicles are being sold in large numbers than formerly. American footwear has its share of trade. Proprietors of the American shoe stores in this city inform me that their sales were never larger than in the past year.

Cotton Machinery in Paraguay.—Paraguay has gone extensively into raising cotton, and it would be well for American manufacturers of cotton machinery, etc., to keep this field in view and send catalogues and prices to this consulate to be given to inquirers.—*John N. Ruffin, Asuncion, Paraguay.*

Knock-Down Office and Home Furniture for Export. The "GUNN" K. D. Sectional Bookcases.

"Gunn" K. D. Sectional Bookcase.

This cut shows our knock-down (flat) construction. It is put together without nails or screws, or dowel-pins; the irons that are fastened to the shelves have upper and lower tongues that fit in the grooves in the bases, center sections and top sections, thereby binding all rigidly together.

SIX-SECTION CASE.

Showing a six-section case with top and base set up, and the same case boxed K. D. ready for shipment; weighing 200 lbs. gross, 150 lbs. net, and of 10 cubic feet, thus securing a low freight rate, occupying but little space in warehouses and on shipboard.

Top Section
List, \$3.00

9 1/4" Section
List, \$4.15

11 1/4" Section
List, \$4.50

13 1/4" Section
List, \$5.25

*Base Section
List, \$2.65

THREE-SECTION CASE.

With top and base set up. Weighs 135 lbs. gross, 100 lbs. net, and of 6 3/4 cubic feet. This cut represents the entire line of sizes, and will make a case for 10 books or 10,000 books, growing as the books accumulate. Measurements are inside. All sections 10 1/2 inches deep and 32 1/2 inches long. Made of selected quarter-sawn oak and handsome polish finish.

THREE-SECTION CASE, as shown, complete - - - each \$10.76
SIX-SECTION CASE, as shown, complete - - - each \$17.98

IMPORTANT NOTICE.—To secure full benefit of above, even sample orders should not be for less than the steamship minimum for issuing ocean bills of lading. Some steamship companies accept not less than 40 cubic feet, while others not less than 80 cubic feet. Six Three-section Cases occupy 40 cubic feet; Four Six-section Cases occupy 40 cubic feet. NOTE explanation of ocean freight on "Gunn" K. D. Cases: "An ocean rate of 10 shillings per 40 cubic feet equals a cost of eight cents per section, or about four per cent. on the cost boxed f. o. b. New York."

Specify "Gunn" when ordering. Orders received direct or through export houses. When ordering through the latter, to avoid errors, please mail us duplicate of order. Our catalogue, illustrating and describing the various styles of Sectional Bookcases and Filing Cabinets made by us, mailed postpaid.

THE GUNN FURNITURE CO., Grand Rapids, U. S. A.

Western Union and A. B. C. Codes used.

Cable Address: "GUNN," Grand Rapids.

We also make a full line of Roll and Flat Top Office Desks and Typewriter Cabinets.

A FEW REASONS WHY THE "GUNN" K. D. SECTIONAL BOOKCASES ADMIT OF DIRECT IMPORTATION TO THE TRADE.

The assortment is SMALL. All parts are INTERCHANGEABLE, making every possible size bookcase from the same stock. They require but little space in warehouses, as the cases are shipped K. D. (flat) and can be set up as required, with no tools but the hands.

Our method of boxing K. D. (flat) insures arrival of goods in PERFECT CONDITION, as NO POSSIBLE DAMAGE CAN OCCUR TO FINISH AND NONE OF THE PARTS CAN SWELL OR WARP, as in ordinary furniture. Deliveries can be made in thirty days, and by using our special code, twenty days.

ADVANTAGES OF THE LINE.

The field to sell is very large, as the same stock meets the demand from offices and public buildings, as well as for home use—in fact, anywhere an article is desired to be covered from dust and moisture. Each sale made is a guarantee of repeated purchases for additional sections, as books accumulate. The sections can be added, vertically or horizontally, to fit the wall and space. The glass doors, when raised, disappear, sliding on small frictionless roller bearings. The "GUNN" is the only case in which a broken glass can be replaced by simply taking off the door, and without removing the books or taking the case apart. The cases, when set up, present a handsome appearance, with no objectionable features, and are as rigid as an ordinary bookcase.

We GUARANTEE the "GUNN" SECTIONAL BOOKCASES PERFECT IN ALL RESPECTS.

Special Offer for Export Only:

The prices here quoted (U. S. gold or its equivalent) include boxing for steamer, and delivered f. o. b. cars at New York City.

New Wood-

Machinery for all purposes of cutting wood, for the smallest blacksmith and wheelwright shop to the largest carshop and shipyard.

Single tools or entire equipments furnished with facility and expedition.

All woodworkers interested in this machinery are invited to write us for particulars of some of the new tools we have just built, which are especially designed for helping them in their work. New catalogue free. Send for sander book and pamphlet on the care of band saws.

We correspond in Spanish.

Working Machinery

No. 57. New Patent Band-Saw Mill.

One of the finest Pony Band Mills for hard and soft wood ever built. We have given special attention to band-saw machinery, and have been eminently successful in its production. We have our band-sawing machines in use all over the world, and letters from users praise their merits in the highest terms. The one here shown has all the features and mechanical improvements that could be offered through our long experience in building this class of machinery.

J. A. FAY & EGAN CO., 164-184 W. Front St., Cincinnati, Ohio, U. S. A.

American Electric Dress on Russian Ships.

DAZZLING displays of electric dressing have been made by the warships of many nations and such attire is now almost indispensable as a part of the equipment of a war vessel of the first class. Five years ago American electricians decked out the Russian Imperial cruiser Variag in the finest style and they have felt a sentimental interest in this splendid product of American workmanship. One of these electricians recently showed a photograph of the vessel in gala attire. He said: "Very beautiful the cruiser looked, on the night when she posed for her picture, lying peacefully in the shining waters of the Delaware River, aglow with her myriad lights that made her seem like a fairy ship afloat on the bosom of a liquid mirror of dappled light and shade. So, too, the Retvizan, that other staunch Russian cruiser, built in America, when, two years later, she lay at the same point in the river, her decorative lights all flashing out brilliantly, at parade rest under the eye of the camera.

"Both the Retvizan and the Variag carried a decorative electrical equipment that was among the prettiest and most elaborate on any of the world's warships. In this respect they were to be the 'show ships' of the Russian navy. It had remained for an American to give the Czar a sample of decorative idea which was comparatively new to certain foreign nations, although it had long ceased to be an innovation in the United States navy. Both of the cruisers carried with them when they left American waters neatly framed photographs, taken at night by a representative of the firm, as souvenirs of the occasions when they lay in the peaceful Delaware River, the cynosures of dazzled and admiring eyes on shore. What a sight it would be if one of these cruisers, ablaze as then, could be brought a captive into a port of Japan!

"It isn't often that one sees a picture of a warship in the full panoply of the electrical adornment. This is partly because it is difficult to take a photograph of this sort and partly because it is only on gala and comparatively rare occasions that the ships possessing such equipment display it. It is a sight that is interesting, as well as beautiful, contrasting somewhat tragically, in the case of these two Russian cruisers, with the grim and actual business of war.

"It was in February, 1902, that the American company delivered the electrical decoration equipment on board the Retvizan. The outfit consisted of a dressing line, outlining the gunnels, water line, forward and aft turrets, stacks and spars; the imperial monogram and crown, the name of the cruiser in Russian letters on the after turret and the Russian flag, all in sixteen-candle power electric lamp. The crown and flag were in three colors. On the dressing line the lamps were strung at distances of three feet along 3,146 feet of twin flexible conducting cable. The total cost of the work was nearly \$5,000. On the Variag, which was equipped in August, 1900, the cost was somewhat less, as she is a smaller boat. The general style of decoration on the two cruisers was practically identical."

As in other features of naval equipment, the United States has led the world in the electrical decoration of warships. Twenty-six of our naval vessels have been fitted out by the electrical company alone.

American Workshops and Industrial Schemes.

IN a recent issue our British contemporary, the *Manchester Guardian*, reports at length a lecture delivered by Hans Renold, an engineer, who has been inspecting American workshops. Mr. Renold was enthusiastic about his visit to America. He declared that the "American workshops were better heated in winter and better ventilated in summer than the British, with the result that the comfort and convenience of the workmen were increased and more work was done." He added: "There is no doubt that in American workshops there is an absence of the griminess which we all feel in Manchester." Another lecture in the series was by Prof. M. E. Sadler. It was on "Learning Through Doing Things," and was based on a visit made by Mr. Sadler to Tuskegee, U. S. A. But it was not confined to Tuskegee. It embraced American schools in general, and according to the *Guardian* report, Professor Sadler predicted a great artistic movement in this country.

"The American schools," he said, "appear to work in an atmosphere in which there is a greater combination of the artistic with the practical than in England;" "and in this connection," continues the report, "he spoke of the probable development of a great artistic movement, and said that if this did not come about the work in the elementary schools would be largely responsible for it."

Is Great Britain Losing Her Colonial Trade?

WR. HOLLOWAY, United States Consul-General at Halifax, Nova Scotia, sends the following, which is of more than passing interest:

"A report has been received here of a lecture delivered in London by Mr. W. A. S. Dewins, secretary of the tariff commission, in which he claimed that, taking the whole of the British possessions in groups, the same movement had been observed in each instance—the percentage of British trade diminished in comparison with the foreign trade of the colonies. The diminution, he said, had been greatest in the case of Canada, where the United States has taken the place of Great Britain. The same movement had occurred in Australia, and though the mother country still had a firm hold of the colonies in Africa the same movement had begun there also. 'Our present system,' he said, 'was practically based upon the assumption that in return for our manufactures we could get food at a cheaper rate.' He predicted that

twenty years hence the United States would require every bushel of wheat that country could grow. It might be said that Canada would take the place of the United States, but the effect of that on prices in England would depend on how Canada took its place. 'If, in Canada,' he said, 'they had a preference on corn it would stimulate agriculture; it would also stimulate a demand for other products in Canada which could be supplied from the mother country.'

Electricity Used in Place of Plumbers.

MANY of the readers of *THE AMERICAN EXPORTER* are never troubled with frozen water pipes, but our patrons are scattered all over the world, and we have some subscribers who live very close to perpetual snow, ice and everything else that comes with winter. In American cities at least for some years the water pipes have been laid under the point of frost interference, but there are many pipes which are not sufficiently beneath the surface to escape freezing when the frost is particularly aggressive. It was discovered in the American city of Newark during the winter just ended that electricity could be used to thaw the pipes, with less expense and none of the trouble that would be involved by calling in the plumbers. This account of it tells the story: "An electric current as an agent for thawing out frozen water pipes seems likely to oust the time-honored plumber from one of his regular functions. First, you call the electrician, maybe the same man who recently fixed your door bell for you. He arrives with a wagon bearing a dynamo and a connecting gasoline engine. Having attached the positive wire of his apparatus to a hydrant outside the house, he fastens the negative wire to the nearest faucet inside. The current, when the gasoline motor has been started, passes through the water pipe underground. Water is a good conductor, ice an insulator. When a current is impressed on an insulator or a bad conductor, heat results. So now the ice melts under the heat generated in the pipe, and soon the thawing is accomplished. In this way a main eight inches in diameter can be cleared within a few minutes."

Model Swinging Bridge to Be Built in America.

CONSTRUCTION on Duluth's "aerial ferry" is to be started soon. It is intended to be a model of what American mechanics can do in this field of endeavor. In the bridge, with its two towers on opposite sides of a canal, will be 650 tons of steel, and the whole structure is to cost \$100,000. A car will swing across from one tower to the other suspended from two idlers, one on each side on the bridge, operating over two idlers and over two drums, which form either side of the car, by two one-inch wire cables. These drums will be turned by electric motors. The towers will be 136 feet high from the water, and from center to center will afford a clear span of 393 feet.

The system has several advantages over a ferry or drawbridge. It leaves the channel clear at all times without requiring vessels to give any special signal or to modify their speed any more than in the case of a channel ferry. The difficulty of landing in case of storm, as with a ferry, is obviated, and all danger of turning turtle is done away with. The suspended car is to be capable of a load of 62½ tons. This will mean about one loaded street car, two or three teams, and altogether about 200 passengers. The car length will be 50 feet and width 40 feet. The cabins on two sides will be finished in curly birch, plate glass, and mirrors, and will resemble a modern steamship cabin.

Mr. Mosely on America's Public Schools.

MR. ALFRED MOSELY, the public spirited and enterprising Britisher, who discovered that this country is more progressive than Great Britain, has written an article for the *World's Work* in which he praises our public school system, and declares that he intends to send his two sons to this country to be educated. He says: "It was wonderful to see the raw peasant lad from Russia or Germany in a few months after landing sitting in an American school and singing 'My Country, 'Tis of Thee.' We saw hundreds of these who in a marvelously short time had caught the American spirit and who were daily saluting the flag, considering themselves part and parcel of the American nation. The teachers showed immense enthusiasm in teaching these little atoms of humanity, and the musical marchings in and out of school, the flag salutes, and the songs they taught the children were decidedly effective devices to engender discipline and patriotism. The same spirit is visible everywhere."

Refrigerating Machinery.—The York Manufacturing Company, of York, Pa., U. S. A., believes in performances instead of promises. It has just issued a booklet giving a list of its customers for the last year and expresses the belief that its references as given are the best evidence of the worth of ice-making and refrigerating machinery. Readers of *THE AMERICAN EXPORTER* can obtain copies of this booklet by addressing the company.

Wireless Work of War Vessel.—The United States cruiser Baltimore holds the record for long-distance wireless talk, so far as the Government is concerned. While 125 miles at sea, bound from New York to Norfolk, recently, wireless communication was opened at Norfolk, U. S. A.

Hand-Blowers.—The Buffalo Forge Company, Buffalo, N. Y., U. S. A., has issued a pamphlet illustrating its new hand-blowers, which will be sent to any of our readers interested in this kind of machinery on request.

MONROE PORCELAIN REFRIGERATORS.

Monroe Refrigerator No. 21. Style D.

THE MONROE IS A HIGH-GRADE REFRIGERATOR, BUILT FOR THE HOUSEHOLD.

Each food compartment is moulded in one solid piece of porcelain. The corners are rounded. There are no joints or crevices for the food to decay in. The porcelain is white, durable, and as easily cleaned as a china dish. The ideal house refrigerator, absolutely sanitary. The prices here quoted for foreign markets only (U. S. gold or its equivalent) include crating, ready for transportation abroad, delivered f. o. b. at New York City.

MONROE No. 21, Style D, Solid Porcelain Inside, \$54.00
Oak Exterior,

Crated, measures 49 x 27 x 47 inches. Gross weight, 630 lbs.

MONROE No. 30, Style E, Solid Porcelain Inside, \$69.00
Oak Exterior,

Crated, measures 49 x 27 x 57 inches. Gross weight, 820 lbs.

All sizes carried in stock ready for immediate shipment.
Special sizes built to order.

Our latest catalogue, illustrating and describing the various styles of Solid Porcelain Refrigerators made by us, mailed postpaid.

Orders received direct or through export commission houses. When ordering through the latter, to prevent errors, kindly mail us a duplicate of order.

Important Improvements in Steam Turbines.

W. L. EMMETT, a prominent American engineer, at a recent meeting of the Engineers' Club, in Philadelphia, U. S. A., read an interesting paper on recent steam turbine developments in this country. The developments have consisted mainly in an improved design and operation of the valves and of the step-bearing of the main shaft, and lastly of the adoption of a four-stage instead of a two-stage machine.

In the first turbine installed for commercial operation at Newport, R. I., some minor difficulties were encountered, principally with the operation of the inlet valves covering the nozzles. This trouble has been corrected and an ingenious arrangement is now used to open and close these valves through the influence of the governor. The pilot valves are now operated by levers, rollers on the end of which rest on cams on a horizontal shaft, which is rotated by the governor. The valves are really operated by steam pressure, and the action is such that they are caused to move from an open to a closed position with a jump in somewhat the same manner as a pop safety-valve. This prohibits any throttling action to the steam, allowing full pressure at the throat of the nozzle and prevents any cutting of the valve seats and disks which might result from throttling.

The four-stage turbines contain four sets of nozzles, and each nozzle delivers the steam to one or more sets of buckets and guides. That there is a considerable advantage is brought out forcibly by remarkable figures obtained from a test of a four-stage turbine of 2,000 kilowatts capacity at the builders' plant.

The tests at a load of 2,400 kilowatts (400 kilowatts overload overrated capacity) gave a consumption of only 13.5 pounds, the best figure ever produced from a turbine unit and equaled by only a very few celebrated reciprocating engine performances. Assuming the very high over-all efficiency of 94 per cent., a steam engine would have to do an indicated horse-power on 9.46 pounds of steam per hour to equal this performance. Very few steam-engine sets can show an over-all efficiency of 94 per cent. At 90 per cent, a figure more common, but still high, the consumption would have to be 9.06 pounds per indicated horse-power per hour to equal the showing made by the turbine.

New Light on Reciprocal Engine Economy.

MANY articles have been recently published giving comparisons between the steam consumption of turbines and reciprocating engines, in which a relatively poor economy for reciprocating engines at light loads is assumed. This has led J. A. Seymour to contribute a timely and exhaustive article to *Power*, in which he points out that this assumption is unwarranted by the actual performance of these engines. Says Mr. Seymour: "Whatever advantages in actual commercial use the steam turbine may ultimately prove to possess, there are no indications at the present time that among these advantages will be a better sustained economy at light loads than with the reciprocating engine. It is true that 'the usual' or 'average' rate of steam consumption of reciprocating engines at light loads is excessive, as compared with the full load economy, but the usual or 'average' reciprocating engine is really an uneconomical and out-of-date machine. The ideal reciprocating engine working with non-conducting cylinder walls without loss from leakage, cylinder condensation or radiation should expand to back pressure to secure greatest economy. To expand to back pressure in an actual engine would load it much below its most economical point. It follows that since a modern engine of economical type, having a much lower rate of steam consumption at full load, approaches more nearly the ideal engine than the above-mentioned average engine, it should effect proportionately a still greater saving at light loads; that is, it should have a flatter economy curve. In actual practice this is found to be true."

Mr. Seymour goes into the subject extensively and gives diagrams and figures to sustain his contention.

Great American Inventor on Flying Machines.

EDISON'S eyes twinkle. His face laughs as he talks. His expression is as quick as the electric spark, and even when the theme is serious there is hidden merriment around his eyes and in the lines of his mouth. Edison's work is his pleasure, and, conversely, his pleasure is his work. The day is too short for him. The night is his paradise. Time, tide, etc., play no part in his habits. Nearing 60, he is as young as most men of 40. His clean-shaven, clear, almost transparent complexion heightens the illusion of youth, and his brisk, supple, graceful step bespeaks the fire of strong vitality in his blood. I am not a hero worshiper, but I have always found that men of power exhale a potential intellectuality. I was not doomed to disappointment on my recent visit to Mr. Edison at his laboratory at Orange, N. J., U. S. A. Upon that occasion I asked him to talk of aerial navigation, to tell me if the problem was approaching solution.

The click of the telegraph instrument could not have been quicker than his reply. "No," he said, "the time has not come for the production of an airship of use commercially—capable of making regular trips from a given place to a given place. One will never be built until a new motive power is produced."

"Would that motive power be found in some form of electricity?"

"I cannot say," he replied to the question. "No man can say that. A new motive power will alone solve the problem, but how I think it should be

solved I will not say. I cannot discuss that. I have thought of it a great deal. I have experimented, I have built light motors, but I have not attempted to fly. The question is wholly and simply one of motive power—a power that is sufficient to combat the force of gravitation, the lack of buoyancy, and sustain itself above the earth.

"The airship must be of simple mechanism. No man can build a machine after the structure of a bird that will fly as a bird flies. The Creator alone did that. He built the bird wonderfully. I have thought of that question often. I have watched them by the hour. Their muscles are peculiarly constructed—all their bones are hollow. They are born 'flying machines.' Their whole body works in harmony. There is nothing mysterious about it, yet a machine built like a bird, if it were possible, could not stand the strain of air currents. A bird is dependent upon the currents—floats on the current. It doesn't soar until it is well up in the air. It flies instinctively."—*The Outing*.

Greater Demand for American Footwear.

SEVERAL American shoe manufacturers have of late turned their attention to the possibilities of further development of the export trade to South America. A gratifying measure of success is said to have rewarded the efforts of a few to introduce new lines of footwear in the countries south of the equator, with the result that other makers of shoes are likely to engage in similar enterprises. A few days ago a New York man left for South America with samples representing the output of fifty-four shoe factories in the United States. It is his intention to spend a couple of years in taking orders for shoes in that part of the world, although he may find it advisable to interrupt his labors by returning to select new samples. An exporter recently said: "In South America the demand for shoes made in the United States seems greater this year than ever before. One firm is introducing in South America lines of shoes that cost at wholesale \$3 to \$3.50 a pair. The cost of shipping and the duties must be added in figuring what is paid by the people who wear the shoes. These shoes are selling well in several countries, so that you will see that these people buy high-grade and expensive shoes."

Frank M. Bedell lately returned from a trip to some of the West Indian islands in the interest of shoe manufacturers. He said that so much progress has been made in Curaçoa that nearly all the shoes for men, women and children come from the United States. The only important exception is that some of the cheaper shoes for children are still imported from Spain, but that will not continue much longer. Mr. Bedell says that Porto Rico is now the same as a home market for the manufacturers of the United States, who have the advantage of the tariff laws. The natives, he says, are taking more and more strongly each year to American styles in shoes, and the more prosperous people buy the best grades that are made in the United States.

Quick Deliveries by Motor Wagons.

IN New York City recently fifteen commercial motor vehicles made a service test under the auspices of the Automobile Club of America. All performed the tasks set them with despatch and without disablement. The greatest distance traveled was 43½ miles by a delivery wagon, the most service stops made were 57 by a light delivery wagon, and the heaviest load carried in one trip was 9,600 pounds, besides the weight of four men, by a truck.

One of the best performances of the day was that by a gasoline wagon, which made fifty-seven deliveries of merchandise in the east side of the city. The distance traveled was 40½ miles, and the time, not including the time the wagon lay idle, was 9 hours and 55 minutes. Another wagon traveled 21 miles, with fifty-three deliveries, and a third covered 35½ miles, with seven deliveries, in 6 hours and 10 minutes.

The lightest machine in the test—a 500-pound affair—traveled 39 miles and made fifty-four deliveries in 9½ hours. A second machine required five minutes more to make fifty deliveries over 33 miles of territory. One truck carried 4,300 pounds of fish from the depot, making deliveries at the markets. The stops were 21, the mileage 32 and the time out 9 hours and 15 minutes.

Precautions Taken by American Exporters.

ONE of the most interesting features of the new plant now being erected by the B. F. Sturtevant Company, at Hyde Park, Mass., is an elaborate testing plate for its engines. With an output of a thousand engines or more per year this is the essential climax of a careful system of manufacture and testing. The plate, or more properly the plates, will be supported upon a series of heavy parallel walls, between which steam and exhaust pipes are carried, so that at almost any point in the entire area of the floor, measuring about 30 by 60 feet, steam and exhaust connections may be made to any engine. Testing facilities will be provided, and a transfer crane overhead will make it very simple to locate or remove the engines. The same crane will transport them to the packing department and thence load them directly upon cars which traverse the end of the building. The Sturtevant company, it will be observed, uses all the precautions that all American manufacturers engaged in the export trade do to make certain that their goods are perfect before they ship the same to their customers.

New Turbine Patent.—George Westinghouse, the American inventor, has taken out a patent for a vertical turbine in which the steam is admitted from below and sustains the weight of the revolving parts.

Point.

Cheapest to Use in
the End.

TESTIMONIAL.

NEW YORK, Aug. 3, 1903.

Messrs. Tarr & Wonson, Ltd., Gloucester, Mass.

Gentlemen: It affords me great pleasure to comment to the credit of your copper paint.

I used your paint on my vessel here December 10, 1902; bottom in poor condition for good coat-damp; remained at the dock here forty-nine days; thence to New London, Conn.; thence to Cay Frances, Cuba, where we remained at anchor in only 18 feet water—water very warm—for eighty-seven days; thence back to New York, when I hauled on dock for painting again, July 5, 1903. I found the surface clean and clear of sea growth of every nature, hence my relative feelings toward your product is, beyond doubt, to the head of the list to stand the severe test as it did of the shoal, warm, clear Cuban water, and I claim its outfit is complete. Yours very truly,

(Signed) A. A. LOWELL, Master Sch. Edward H. Blake.

Snow Locomotives with Enormous Power.

MOTORS for traction purposes are manufactured in America in great variety, and the use of electricity, steam and other power has increased to a remarkable degree. Most of these traction motors are of comparatively limited horse-power. In the American State of northern Michigan, however, one was constructed and operated last winter, which is really a giant of its kind. It is known in the lumbering region where it is used as a "snow locomotive," for the reason that it has been used principally during the winter season in hauling loads of logs through the woods to the sawmill. The motor represents no less than 200 horse-power, and is capable of hauling 100 tons of weight through snow-beds which range from 2 to 3 feet in depth and across a country where there is not even a footpath. Under these conditions the locomotive will attain a speed varying between three and four miles an hour, according to the condition of the surface over which it is moved. Tests upon a hard and fairly smooth surface, such as packed snow or ice, show that it will develop a speed of six miles an hour, yet hauling 150 tons.

This tractor differs radically in design from others which are utilized for hauling heavy weights. It was constructed after the plans of George T. Glover, of Chicago, its inventor, and possesses some peculiarly interesting features. One of these "snow locomotives" can be described to give an idea to our readers of the principle on which they are constructed and operated. It weighs twenty-five tons, but is attached to the runners in such a way that much of its weight can be shifted to bear directly upon what is known as the traction wheel. This portion of the engine is a hollow cylinder of boiler iron, and is provided with a series of three-cornered teeth, which are set in rows upon its face. Each is fastened to the wheel independently of the others, so that it can be quickly replaced if desired. The wheel moves upon a hinged frame which automatically raises and lowers it as it moves over the surface, adjusting it to the inequalities of the route, while the teeth, continually gripping the surface, furnish a tractive force which permits the engine to move where a motor of much greater horse-power would be unable to stir.

A curious feature of this traction wheel is that the hollow drum is connected with a steam pipe through which is discharged the exhaust steam. This keeps the drum heated to a high temperature, and as it comes in contact with the snow it rapidly melts the latter material, which, as it is packed down, makes a firm surface for the runners of the engine and the trucks which follow it. In this way the motor literally constructs its own roadbed. The drum is, naturally, built very heavily to withstand the hard usage it receives, the walls which support the teeth being $1\frac{1}{2}$ inches thick. It is 6 feet in diameter and weighs seven tons.

When additional tractive force is desired the weight of the engine is transferred to the drum by special apparatus. A powerful steam cylinder, called a "nigger," is so arranged that by merely pulling a throttle valve the engineer can operate it, with the result that the additional load is placed upon the drum almost instantly. The traction wheel is connected with the balance of the engine by gearing which represents three degrees of speed, and in this feature it resembles the ordinary pleasure automobile. The slow gear is used in starting the train in ascending grades and in places where the route is more than usually difficult. When the speed can be safely increased, the engineer uses what is called the fast clutch, which allows a rate of seven miles an hour if desired. By admitting more steam into the driving cylinders he can increase his speed accordingly. A rate of as high as twelve miles an hour has been attained by the locomotive with a light load.

Some portions of the forest where the snow locomotive has been in service are low and swampy, being partly covered with water in the spring, while in mild weather, in the winter season, the snow may cover the soft spots to a depth of several feet, thus offering little resistance. In fact, it would be impossible for a team of horses to pass over some of these spots without being "mired." Tests of the strength of the snow locomotive have been made by forcing it through this marsh land, and, with the aid of the traction wheel, the experiments have been successful. It has been used at the end of the winter season by substituting wheels for runners. Even where the surface is largely composed of sand, it develops such traction that it can be forced through this material while pulling loads varying from 50 to 100 tons. In fact, its performances seem almost incredible, considering the topography of the country.

Curiosities of Map-Making in America.

ALARGE number of models of cities, mines and buildings and relief maps for the St. Louis Exposition have been made by E. E. Howell, of Washington, who, according to the children of his neighborhood, keeps a "geology store." The making of one of these large relief maps, is an interesting operation. If ordered, for example, to furnish a relief map of the Yellowstone Park, the great American natural park, Mr. Howell would use as a guide a topographical map of that reservation, showing the contour of the country in lines, indicating heights or depths of 100 feet on the vertical scale. With this may he would proceed to cut out of pasteboard, the thickness of which would correspond to the one-eighth or one-tenth inch by which the 100-foot contour is shown on the map, that part of the Yellowstone Park representing the lowest part of its surface. This he would tack down on a wooden tray or table, forming the base of the relief map, after which he would cut out the next contour of the country, tacking it down in the place on the lowest one. Thus, taking the map as a pattern, he would cut out of pasteboard each level, until every hill and mountain and the entire surface of the

country would be built up and shown in successive terraces of pasteboard on the wooden platform or tray.

But in nature the face of the country is not always thus sharply outlined. Only in the Grand Cañon of the Colorado of the United States and the mesa country of Arizona are the successive levels marked by sheer cliffs and wall-like terraces, for the reason that the rainfall is not sufficient to round it off and give the region that aspect of gentle slopes and inclines seen in other parts of the world.

When the map has been fully built up in this way, therefore, one of the artists in Mr. Howell's employ takes charge of the work and covers the face of the country with modeler's composition, or patent clay, so that when finished it is a reproduction in miniature of the region which it is intended to represent. This is called the model, and from this model a cast is made in plaster of paris, which is affixed to a firm wooden base, painted in proper colors, and varnished.

One of the most difficult maps of this sort that Mr. Howell has completed for the Exposition was that of the Black Hills region of South Dakota. Those who have never visited that region have little idea what a jumble of hills and valleys it is. Looking at the relief map, one wonders how the early gold-diggers found their way in and out of the hills.

Frequently orders are given for maps in which cities, railroads and mines appear, and then the artists are obliged to construct miniature buildings out of pasteboard, tin, lead and wood, painting them the colors of the original. Mr. Howell is now filling an order for a relief map of St. Elizabeth Insane Asylum and another of Butte, Mont., and the Anaconda copper mine. That part of his shop in which these maps are being made looks like the Noah's Ark department of a toy factory.

The Lighting of the Future.

IN discussing the lighting of the future the *Electrical World and Engineer* says: "Of all known illuminants electric light is easily the first, from a hygienic standpoint, since the light is produced without sensible combustion. This virtue and its excellent color value conspire to give it a very strong hold on public favor, but as regards the former characteristic few people are willing to pay, when in good health, any considerable price for hygienic conditions, and as regards the latter, it is fully equaled, for instance, by acetylene. In the last resort, therefore, the battle of illuminants resolves itself into a contest for economy, modified only by the dictates of fashion and external appearances. At the present time electric lighting has the upper hand of its competitors, but it can retain it only by constant fighting. It has, of course, certain strongholds from which it cannot easily be driven.

"At the present time the electric arc is by a very perceptible amount the cheapest all-round illuminant, and this fact is the strongest ally of incandescent lighting. For while cheap gas in mantle-burners can undoubtedly beat out the incandescent lamp, candle for candle, in mere cost it cannot meet the arc on even terms, and if the consumer is deaf to all arguments based on hygiene and color-blind to boot, the central station still holds a trump card in the arc. The intensifying mantle-burners in their various forms can beat out the arc indoors, so far as price is concerned, but are at a disadvantage out of doors, and require some species of local plant which works to their disadvantage in the matter of convenience.

"Two things we need in electric lighting for the immediate future: One is a lamp of moderate power, moderate intrinsic brilliancy, good color and high economy to replace or supplement the present glow lamp. The other is a very efficient lamp of almost any power and brilliancy, with plenty of red and yellow in its spectrum, and capable of operating when fully inclosed and practically without attention."

We do not entirely agree with our contemporary regarding the use of gas, for it is a well-known fact that American inventors have placed in successful operation some very satisfactory systems of improved illumination by gas, both for indoor and outdoor lighting. Some of these systems have been given great praise by persons who have used them in other countries.

Wire, Wire Nails and Pipe.—Exports of American wire nails and pipe in the month of March gained over the outgo for the previous month, as did other manufactures of this sort. Of wire it is interesting to note that South America was the most important customer, taking 1,115 tons. Europe received 850 tons, while to Australia shipments were made amounting to 811 tons. Mexico, South Africa and other purchasing centers received smaller quantities. The 2,000 tons of wire nails went chiefly to Europe and the Far East. The pipe exports went chiefly to Europe.

Our Trade with Colombia.—United States Consular Agent Granger, at Quibdo, the commercial center of the Choco district of Colombia, reports that the imports of that region are increasing, and adds: "The principal imports are mining and agricultural machinery, corrugated iron, barbed wire, kerosene, tools (including machetes and axes), provisions and dry goods, nearly all of which come from the United States."

German Officials Inspecting American Steel Plants.—Three prominent German Government officials are now on a tour of inspection of the big steel and other manufacturing plants in the United States. They are Herr Havenstein, president of the Royal Prussian Bank; Herr Doenhoff, privy counselor of the Department of Commerce, and Dr. Von Loehr, privy counselor of the Foreign Office.

HAVE YOU SEEN THE

Schroeder Rotary Washer?

It is the most perfect and successful Rotary Washer on the market. The tub is made of red Louisiana cypress, which will not fall apart. All castings are finished with rust-proof aluminum paint; all iron parts coming in contact with the clothes are heavily galvanized. We also make other washers. For particulars address

The Handy Fruit and Vegetable Slicer

The most interesting kitchen utensil ever invented. It slices every kind of fruit or vegetable into an infinite variety of unique and fancy designs, making an entirely new, novel and delicious product.

Is invaluable for making delicate salads, garnishings, etc. Makes **Juliennes** ten times as fast as by the ordinary method and is the only utensil that will produce **Lattice Potatoes**. Is extremely simple to operate and sells rapidly wherever shown.

\$16.50 Upon receipt of **SIXTEEN** and **50-100 DOLLARS** **100** in U. S. Gold or its equivalent, we will deliver boxed, ready for steamer, F. O. B. cars New York, one gross [144] **No. 6 X SLICERS**, for Export only. Weight boxed, 120 lbs.

NOTE.—To facilitate our rapidly increasing export trade we desire to arrange with one responsible business house in each trade center of the world, to handle our **NO. 6 X SLICERS** and other specialties manufactured by us.

SCIENCE AND THE FARMERS.

Millions Spent That Will Benefit Foreign Soil Tillers, as Well as Americans.

WE have had frequent occasion to mention the effective work done by the United States Department of Agriculture in behalf of the farmers and other cultivators of almost everything outside of manufactures. Secretary Wilson, who is at the head of the department, wants the American Congress to let him spend \$240,000 more than usual in the ensuing year, and in his argument in behalf of the proposition presented such a comprehensive view of his own field that in its relation to American progress otherwise many of our readers will find his argument as summarized below of interest to them, it being borne in mind that the localities mentioned are all in the United States:

"By definite tests and work our Government scientists have relentlessly tested theories in the crucible of practice; have driven many fallacies out of the farmer's mind; have taught the farmer to know instead of to guess, and are establishing the great science of agriculture more firmly upon a body of ascertained and definite knowledge. Fifteen years ago it was a common farm practice to cook food for domestic animals. Millions of dollars were invested in appliances for this purpose. Several State experiment stations made exhaustive tests in feeding experiments to determine whether or not this practice was profitable. It was clearly proved that it did not pay, and to-day there is hardly a farmer in the United States who cooks food for his stock. By this one demonstration the experiment stations have saved more money to the farmers of the United States than their total cost since their original establishment. The irrigation experiments of the California station have resulted in the reclamation and use of hundreds of thousands, if not millions, of acres of alkali lands, and will result beyond any question in the profitable use of many millions more acres of those lands.

"The Minnesota station, in the development of new varieties of wheat, has materially benefited the entire wheat industry of the nation. The Illinois station, through the selection and breeding of corn, is not only increasing the corn yield, but is breeding into the grain itself a larger proportion of protein and making it a more valuable ration for both men and animals. The experiment stations of New England and the South, through their fertilizer tests, have pretty nearly driven useless and fraudulent fertilizers out of the American market, and have saved money enough to the farmers of the United States to pay all the agricultural appropriation bills of the United States Government for ten years. In every State the experiment stations are teaching farmers to stop waste upon the farm. They are demonstrating the value of good cows and good horses and good sheep. They are teaching intelligent swine husbandry. They are fighting by the best scientific means known the diseases which affect all farm animals. They are intelligently seeking to limit or stop the ravages of insects which damage or destroy farm crops. They are teaching the lessons of tillage, of manuring, of rotation of crops, of the proper construction of buildings, of the care of farm animals, the lessons of breeding, the care of milk, the profitable production of butter and cheese, the use of machinery, the value of drainage, the construction of silos and the renovation of soils. They are constantly testing new varieties of fruit, of grains and of grasses. There are 755 men engaged in the work of these stations. One-half of this number gives more or less instruction in the agricultural colleges. A large portion of them do some work in the farmers' institutes of the several States. Last year 810,000 farmers were registered as attending the meetings of the farmers' institutes. The information given by the experiment station workers is greatly sought by this large body of intelligent farmers, who make practical use of the knowledge which they receive. The value of agricultural experiment stations is recognized by every civilized nation. In view of the fact that agriculture is still our greatest interest, and that this Government is thoroughly committed to the policy of maintaining and developing that interest; in view of the fact that our agricultural production has increased from \$4,000,000,000 in 1887, when the experiment stations were established, to \$9,000,000,000 in 1900; in view of the fact that the appropriations to the Department of Agriculture have doubled in seven years to the very great benefit of our agricultural interest, and in view of the fact that the agricultural experiment stations have unquestionably added as much to the wealth of the United States as any educational force in the nation, it appears that the small additional increase in the appropriation to the experiment stations desired can very properly be given."

It ought to be added, without detracting from the credit due for the marvelously good work done by Secretary Wilson's department, that the American farmers owe as much, if not more, to the inventors and manufacturers of agricultural machinery than they do directly to the Government. Our manufacturers are indebted in a measure to the information which the department has given them, but they have responded more than promptly with new apparatus or machinery, when advisable, and with improvements upon old designs when such a course was necessary. In a word, our readers in other countries are put in the position of being able to obtain the same improved machinery for agricultural purposes that American farmers can secure, as the result of the expenditure of millions of dollars by the United States Government.

Must Want Our Machinery.—Full-page advertisements of American wood-working machinery in English timber trade journals indicate that there is something doing in that direction.—*The Woodworker.*

American Progressiveness Affects Gera.

UNITED STATES CONSULAR AGENT NEUER, at Gera, Germany, makes the following report: "As far as exports from this district to the United States are concerned, it is admitted on all sides that though there may be a partial improvement from time to time, the large quantities of former years will never be reached again. United States manufacturers are too progressive, and while the woolen dress goods industry there is as yet in its infancy it is turning out fabrics comparing most favorably with the best qualities made here, as becomes evident by the fact that many Gera makes have ceased to be articles of export. Besides, technical education in the United States is advancing at such rapid strides as to play already an important part in production."

Consular Agent Neuer quotes an article from a German newspaper, some portions of which are of international interest: "So far England has been one of the keenest rivals of Germany in the expansion of foreign trade. The United States has become, however, a dangerous competitor in the commercial race of nations, shown by her increasing trade with Canada. Even chemicals, an article hitherto almost monopolized by Germany in the world's markets, shows increased exports from the United States to the neighboring Dominion.

"A similar evidence is furnished by the Central and South American republics with which trade has been successfully built up and maintained for many years by German diligence, skill and perseverance, and in spite of English endeavors for superiority. United States enterprises in Mexico are increasing from day to day. Americans are building railroads and are engaged in mining. Machinery and supplies for mines come from the United States.

"The introduction of all kinds of machines into the Argentine Republic keeps pace with the development of this country, but it is especially the importation of United States thrashing and sewing machines, railway supplies, vehicles of all classes and manufactured goods in general which shows a material increase.

"In Bolivia, where Germany holds the first place in both imports and exports, and where Germans had almost exclusive control of trade generally, it is the United States which is beginning to make herself most seriously felt in commercial undertakings. A like tendency prevails with regard to commerce with Colombia, Haiti, Costa Rica, Guatemala, Venezuela, Brazil and Ecuador.

"But, aside from the American continent, increased efforts of the United States manufacturing and exporting interests are made in the Far East, and this with remarkable success. Since the occupation of Formosa by the Japanese larger exports to and imports from the parent country are to be observed, but the retrogression of German imports into Formosa is to be attributed in the main to American competition."

Old Methods Never Safe from Change.

KEEN perception of possibility for improvement was shown, according to a writer in *World's Work* for May, by an engineer who measures up to the usual American standard. This engineer was asked some years ago to visit a copper mine in northern Michigan and design some ore-crushing stamps. He accordingly went to the mines, where, for the first time in his life, he saw stamps at work. He found them reared on a huge foundation of spring timbers and rubber-sheeting, which was supposed to add to the efficiency of the stamps. His simple comment was: "If I were trying to crush rock I would not start to do it on a feather-bed."

He suggested that the spring timbers be replaced by a solid mass of iron, so that the blow of a stamp should wholly expend itself in crushing rock, and not largely in compressing an immense elastic mass with utter waste of power. Only at the end of two years did the company permit him to build such a stamp. It did just 60 per cent. more work than the old machinery. During forty years elastic cushions under every mining stamp in the world had been wasting almost one-half the applied energy. So it goes with the new spirit of improvement that has been so much in evidence in the last few years in the United States.

American Boots and Shoes in Denmark.

UNITED STATES CONSUL RAYMOND R. FRAZIER, at Copenhagen, reports that the American-made shoe is popular in Denmark.

Two of the foremost shoe stores in Copenhagen use the American shoe for a "leader" in their splendid show-window exhibits. Many stores display the American shoes conspicuously. One leading shoe store makes a specialty of American-made rubber footwear, including rubber boots of all sizes. The largest department store in the kingdom carries a full stock of American shoes (except patent leathers) and an especially good stock of women's and children's "storm rubbers." The climate in Denmark is moist. For nine-tenths of the year the sidewalks are wet with rain or snow practically all the time, but the wearing of rubbers, strange to say, is a comparatively recent custom. There is a promising future for American-made rubbers in this market.

Denmark is now the fifth best European customer of American boots and shoes, though five years ago the American shoe was practically unknown there. Since then our goods have come into more extensive use. The people of Denmark recognize good boots and shoes, and the exporters of the United States are reaping their share of benefit.

in English, Spanish, German or French accompanies each Game Board. PLEASE SPECIFY LANGUAGE DESIRED.

Price, per dozen,.....\$32.00.

NOTE.—Each Game Board measures twenty-nine (29) inches square (53.16 centimeters); one dozen Game Boards, boxed for export, weigh 206 pounds (96.4 kilos, 13.76 cubic feet (0.3896 cubic meters).

[illegible]

Visitors to the World's Exposition are cordially invited to visit our WORKS at LUDINGTON, MICHIGAN, U. S. A.

Variety of kinds suited to the requirements of any country. Correspondence solicited. Catalogues furnished in English, German and Spanish.

RODERICK LEAN MFG. CO., Mansfield, Ohio, U. S. A.

Australian Representative, J. BARRE JOHNSTON & Co., Leake St., Freemantle, W. A., and
20 Loftus Street, Sydney.
South African Representative, A. G. ENOCK & Co., P. O. Box 471, Durban, Natal, and
P. O. Box 5062, Johannesburg.

TRADE MARK

An illustration of a roll of 'SMOOTH-ON' tape. The roll is shown partially unrolled, revealing a repeating diamond-shaped pattern. Each diamond contains the words 'SMOOTH-ON' in a bold, serif font, with 'TRADE MARK' written below it. The background of the tape has a fine, vertical ribbed texture. The roll is positioned on the left side of the frame, curving towards the right.

Smooth-On Cement Packing will withstand very high temperatures and pressures, and is used with success for gas engine cylinder heads, with water jackets. It is especially adapted for steam and hydraulic work. Gaskets that have been in use can be used again, with a thin coating of Smooth-On Cement No. 1 on the gasket to fill uneven places when necessary.

**SMOOTH-ON MFG. CO.,
JERSEY CITY, N. J., U. S. A.**

No. 60.

No. 60. 60 inches long; 36 inches wide; 52 inches high; weight 400 pounds
No. 61. 66 inches long; 36 inches wide; 52 inches high; weight 425 pounds

A SWELL FRONT desk of exceptional value to every desk user. Card index drawer with follow block attachment; private compartment with flat keyed spring lock; letter file complete; 11 pigeon-hole boxes, 9 inches deep. Special arrangement for stationery, memorandum books, etc. File boxes and card index drawer, trimmed with cast-brass holders and highly polished cast-brass knob pulls; all parts highly polished.

Special attention given to filling Export Orders. Send for Illustrated Catalogue and Export Price List. Order through buying and shipping agents, and send us duplicate of orders, so as to avoid mistakes.

Bottles Are Now Manufactured by Electricity.

PROBABLY nowhere is there to be found among all the vast manufacturing industries of the United States a process more interesting, yet less familiar, than that by which the enormous quantities of glass bottles are produced, says a writer in the *American Inventor*. But little consideration is given by the average person to how the innumerable commodities used for the furtherance of our welfare are secured, and probably no thought is given to the methods and appliances used and the vast armies of workmen employed in the production of the insignificant glass bottle. Great improvements have been made from time to time in the methods and appliances used in the production of this commodity, with a consequent reduction in price to the consumer, while at the same time improving the quality of the manufactured article.

The plant of a certain glass manufacturing concern, now the largest of its kind in the world, is, if we consider the methods and processes there adopted, representative of modern practice in pottery-making. This plant was founded in 1872 and the early efforts of the concern were so successful that they were encouraged to continue and expand, and the business has gradually grown from a one-furnace plant to an industry covering an area of fifty-two acres of ground.

Favorably situated with most excellent shipping facilities and cheap fuel, of which great quantities are required, it engages the service of 3,500 employees and produces over 1,000,000 gross of glass bottles per annum, ranging in size from one-sixteenth capacity to twenty gallons capacity, and in grade from the cheapest amber and green beer and patent medicine bottles to the highest grade of flint glass perfumery and pharmaceutical ware.

With the growth of the industry advance from old methods has been continuous. The old round type "pot" furnaces in which the raw materials were melted to the mixture of liquid glass in small "pots" have been supplanted with what is known as the "continuous furnace." These furnaces are designed to supply continuously a perfect mixture at a uniform temperature, this being one of the most rigid requirements for the production of perfect ware. The fuel used is producer gas, and the fires are never permitted to die during the working period of the year, which extends from September 1st to July 1st, the months of July and August being reserved for factory renovation and repair.

Until recently all bottles were "blown by hand" (to use a colloquial trade expression) in molds immediately adjoining the furnaces. Improvements in practice, however, have evolved a machine by which wide-mouthed bottles in all sizes are blown in the molds by compressed air. It was in connection with this work that electricity first entered the field in any other than an illuminating capacity, and by the adoption of steel plate fans driven directly by electric motors and installing one such unit in each factory, immediately adjacent to the work to be done, the power consumed per factory was reduced nearly 80 per cent, and the efficiency of the system very materially raised by affording a more uniform temperature to the molds and by supplying a quantity of fresh air about the workmen.

For blowing the machine glassware compressed air at a pressure of eighty-five pounds to the square inch is supplied by an electrically driven air compressor, having a capacity of nearly 1,000 cubic feet of free air per minute. The tops of the bottles are given a finishing touch after leaving the molds. This process consists in placing the bottles in proper receptacles with the upper end of the neck in an intensely hot gas flame. When heated to the proper temperature the tops are molded into shape by hand molds placed over them, while the bottles are at the same time rapidly revolved. There are other features of the process that we have not the space to print in detail.

Automobile the Cheaper.—If a man be willing to figure pleasure as interest on his money, he may, by investing a somewhat larger sum at the outset, maintain a small motor car for considerably less than he can keep a horse and carriage. The figures given show: Cost of horse and vehicle, \$450; cost of keeping, \$434. Cost of motor car, \$650; cost of maintaining, \$341. This gives an excess of \$200 in the first cost of the automobile and a saving of \$93 in the cost of maintenance. A gallon of gasoline will run a light motor car from 20 to 30 miles, but for the sake of being conservative estimate the fuel at five gallons for 100 miles and the average cost of it at 18 cents per gallon. This brings the operating expense to 90 cents per 100 miles.—*Everybody's Magazine*.
